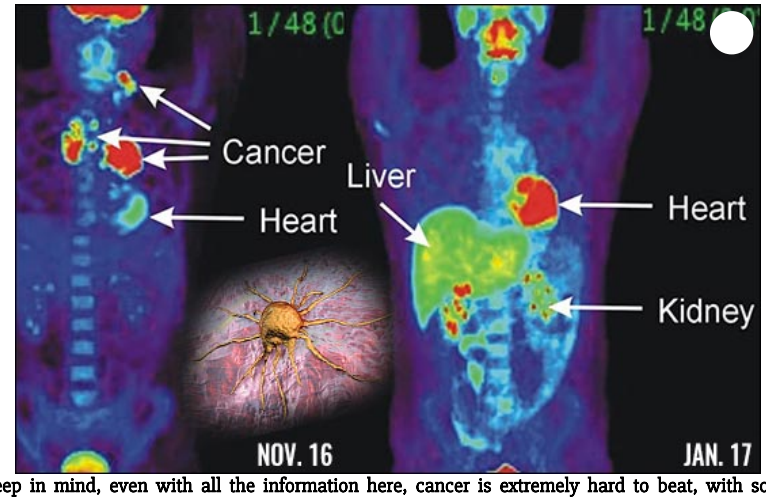
CANCER: SCIENCE, CAUSES, PROFITS, AND EXPLORING THE EFFECTIVENESS OF ALTERNATIVE CURES

By: Joel v.d. Reijden | **Date:** May 4, 2024 | **Last update:** Sep. 12, 2025 | HEALTH CENTER.



Keep in mind, even with all the information here, cancer is extremely hard to beat, with some versions nearly impossible. While pretty much no one goes "full Gerson" (vegetables only), for many people even all other therapies combined here will not fully stop their cancer. Don't ignore traditional forms of treatment.

Scientific quotes demonstrating natural cures

"Based on our data, the predicted incidence rate of colon and rectal cancer [CRC] in 2030 will increase by 90% and 124% in patients aged 20 to 34 years. ... A 1.5% per year increase [or 25% total] in the incidence of CRC ... from 1992 to 2005 aged 20 to 49 years of age has been previously observed. ... Similar results have been observed in young women with breast cancer."

~ Jan. 2015, JAMA Surgery. [1]

"Juice mixtures (at a 7:3 ratio) showed synergistic effects [of] ***71%*** *[inhibition] with high amounts of cabbage and chlorella (CChH; 800 mg/kg),* ***74%*** *with high amounts of cabbage and kale [versus]* ***75%*** *with [traditional heartburn and peptic ulcer inhibitor drug] cimetidine. [Thus cabbage,] chlorella or kale [are perfect for] the prevention and treatment of gastric cancer and gastritis."*

~ May 2013, Journal of the Korean Society of Food Science and Nutrition. [2] Just one of the natural, preventative food sources against cancer.

INTRO

My personal "prep" for potential cancer

Apart from personal interest in anything health-related, I have passed the age of 40. And with that, certain worries all of a sudden started creeping up that I've never had before. Something goes wrong in your body and you go:

> *"Mmm, maybe it's cancer. I should have it checked out. Maybe I also should do some additional preventive tests..."*

I don't have any money to get myself tested, nor anyone that can take care of me when I do end up with cancer - so studying to eat more healthy was the next logical thing to do. That's the perspective of the past few health articles. Now this follow-up article really was written from the perspective of:

1. What will I do if tomorrow I get diagnozed with cancer?
2. What alternative methods next to the traditional ones exist and actually are effective?
3. Can these methods be combined?
4. All these people dying from cancer in their YouTube journey videos, to what extent did they optimize any alternative and mainstream treatments? Or make any mistakes?

A lot of people will have heard stories of alternative theories either working or not working, but as usual, information, misinformation and disinformation is scattered all over the place, not to mention Google censorship these days of any "non-authoritative" content and the usual high-handed, dismissive, derisive rent-a-skeptic and oncology "experts" cited in the media. I say, "expert", because to remain a formally recognized "expert" - with media attention - you are going to have to repeat industry dogma with little to no coloring outside the lines. Everybody knows this; despite many not willing to admit it. But even Henry Kissinger, a 67-year Bilderberg veteran involved in about 200 globalist think tanks and conferences, defined *"an "expert" as a person who is capable of articulating the consensus of people with power."*[3]

In any case, a new research article was needed to gain some true insight.

Cancer: DNA-mutated cells that overproliferate

The following description of cancer might be a bit dry, but it may be very useful for those who have no idea what cancer actually is (besides "deadly"):

At the basis, cancer simply is the abnormal and uncontrolled growth of ordinary body cells that have mutated. This is why cancer can develop in any tissue or organ, including the brain, colon, lungs, liver, skin, blood, and bones. If this is enough for you to know, skip the rest of this section.

The initial cancerous mutation occurs when a cell's DNA is damaged, often due to factors like:

1. genetic predisposition;
2. exposure to harmful chemicals;
3. radiation;
4. infections;
5. or weakened immune defenses, which can be influenced by aging, poor diet, chronic sleep deprivation [4], or other lifestyle factors.

If this damage remains unrepaired, it disrupts normal cellular functions, leading to uncontrolled growth and division.

Mutations occur when DNA damage escapes the body's natural repair mechanisms, which are designed to fix errors during cell replication. These mechanisms rely on proteins and enzymes that need essential nutrients, such as magnesium, to function properly. If these repair systems are overwhelmed, impaired by deficiencies, or affected by aging, toxins, or other stressors, the damage can persist. Persistent DNA damage disrupts normal cell functions, potentially triggering uncontrolled growth. Over time, these unchecked cells can accumulate further mutations, increasing the risk of cancer development.

Benign versus malignant tumors: different set and-or number of DNA mutations

Essentially, the difference between benign and malignant tumors lies in the number and type of DNA mutations in tumor cells, particularly in oncogenes and tumor suppressor genes. Benign tumors generally do not invade surrounding tissues due to mechanisms like contact inhibition, which tells cells to stop growing once they are in contact with neighboring cells. Even when the RAS/KRAS (onco)gene is mutated, increasing cell growth, the other intact mechanisms still prevent the benign tumor from spreading and becoming malignant.

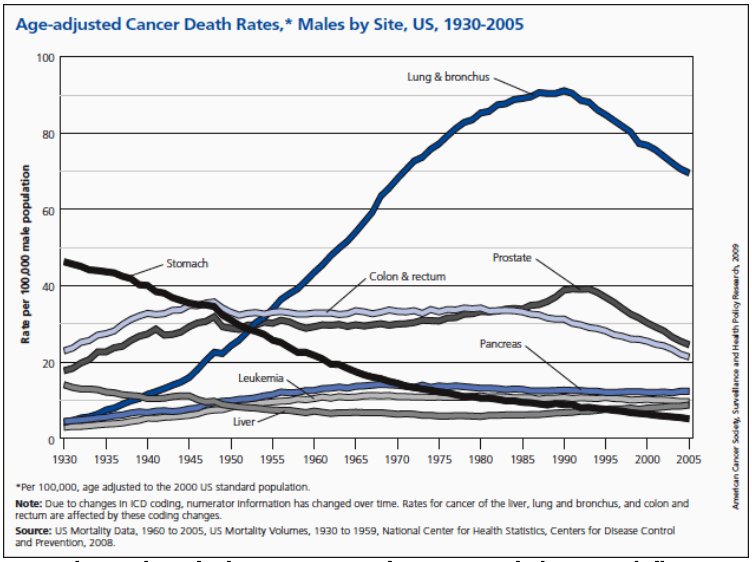
However, with malignant tumors, you, for example, have a RAS/KRAS oncogen mutation combined with additional mutations in other oncogenes as BRAF or MYC; or in tumor suppressor genes, such as TP53 (commonly mutated in many malignant cancers) and BRCA1/BRCA2 (strongly tied to breast and ovarian cancers), which together create a malignant cancerous cell by removing additional brakes on cell proliferation, evading the body's natural defenses, blocking cell death (apoptosis), mutating and feeding off surrounding cells and stimulating

blood vessel growth. Now the (malignant) tumor starts invading neigboring tissue. Once it reaches the blood or lymphatic system, it can travel to all parts of the body.

Cancer statistics: mortality (treatment-based) going down, but incidence going up

Per the usual, it turns out to be much harder than expected to acquire the seemingly most obviously useful statistics possible: namely what the incidence and mortality rate of each form of cancer has been, preferably all the way back into the 19th century. But no, almost all the information to be found is short-term, isolated per form of cancer, and focused on "mortality", which has a habit of covering up underlying reasons for the development of cancer. So we have to piece things together manually.

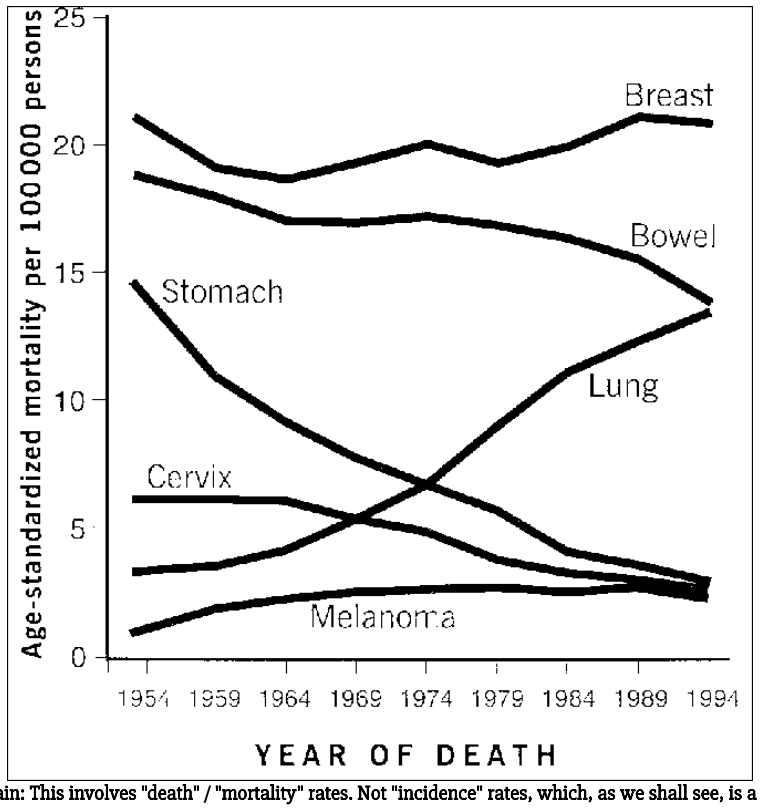
After a lot of searching, the following long-term statistic has been one of the most useful. It immediately demonstrates, for example, just how disastrous smoking has been on the human population, and how scandalous the cover up of it has been by tobacco companies:



Age-adjusted Cancer Death Rates,* Males by Site, US, 1930-2005
Rate per 100,000 male population
100
80
60
40
20
0
Lung & bronchus
Stomach
Colon & rectum
Prostate
Pancreas
Leukemia
Liver
1930 1935 1940 1945 1950 1955 1960 1965 1970 1975 1980 1985 1990 1995 2000 2005
*Per 100,000, age adjusted to the 2000 US standard population.
Note: Due to changes in ICD coding, numerator information has changed over time. Rates for cancer of the liver, lung and bronchus, and colon and rectum are affected by these coding changes.
Source: US Mortality Data, 1960 to 2005, US Mortality Volumes, 1930 to 1959, National Center for Health Statistics, Centers for Disease Control and Prevention, 2008.
American Cancer Society, Surveillance and Health Policy Research, 2009

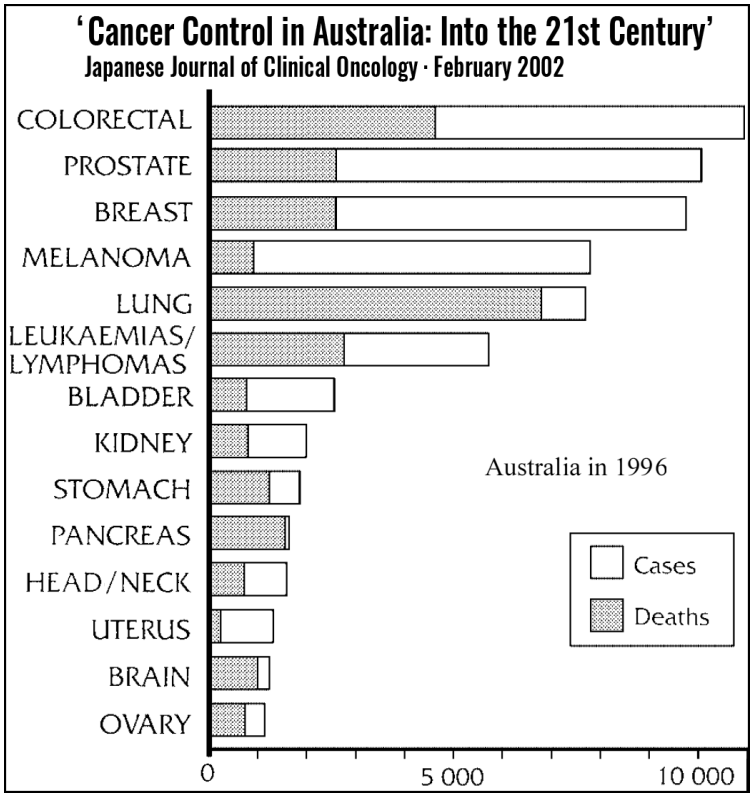
Important: This involves "death" rates. Not "incidence" rates, which, as we shall see, is a big difference.

The following, overlapping statistics from Australia similarly are very useful:



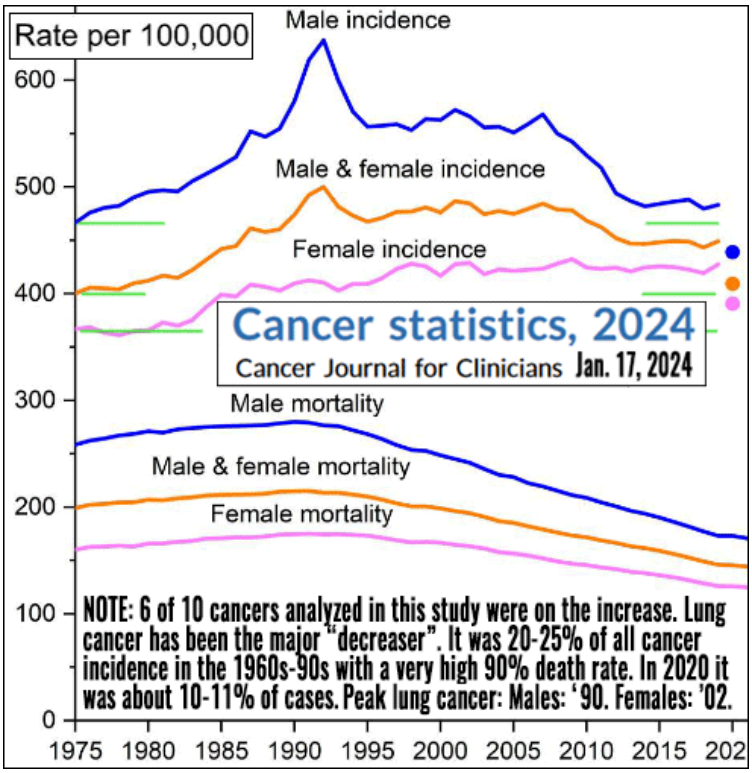
Again: This involves "death" / "mortality" rates. Not "incidence" rates, which, as we shall see, is a big difference.

From the same study we get the following useful numbers, showing that lung cancer has been the third most deadly cancer in terms of survival rate behind pancreatic cancer and brain cancer (usually glioblastomas):



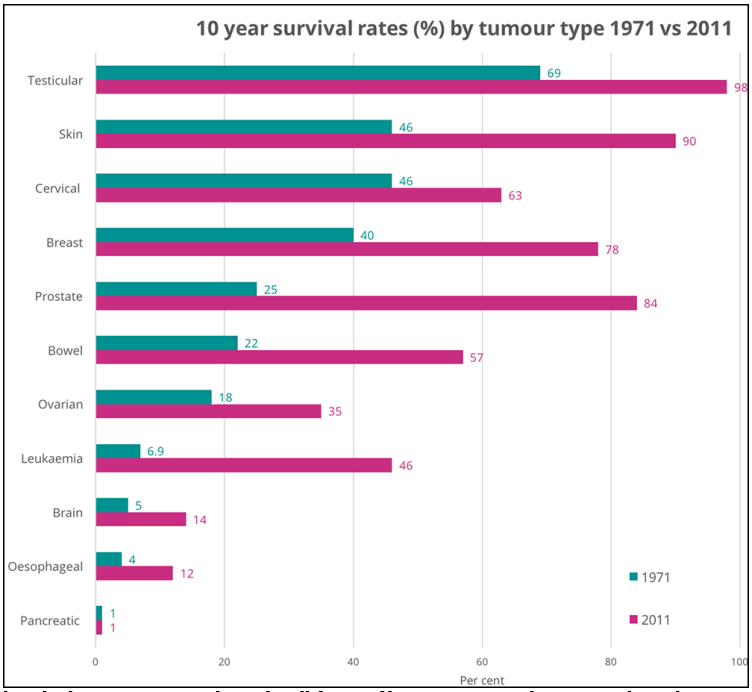
What we really need to though is incidence versus mortality rates. Cancer cures, however invasive and often with permanent side-effects,

have improved over time. But in the end we should be at least as interested in how to prevent cancer, and figure out what is causing cancer. For that, we need incidence rate. Below we have that:



Rate per 100,000
Male incidence
Male & female incidence
Female incidence
Cancer statistics, 2024
Cancer Journal for Clinicians Jan. 17, 2024
Male mortality
Male & female mortality
Female mortality
NOTE: 6 of 10 cancers analyzed in this study were on the increase. Lung cancer has been the major "decreaser". It was 20-25% of all cancer incidence in the 1960s-90s with a very high 90% death rate. In 2020 it was about 10-11% of cases. Peak lung cancer: Males: '90. Females: '02.
600
500
400
300
200
100
0
1975 1980 1985 1990 1995 2000 2005 2010 2015 202

As we can see in the oversight below, survival rates for many forms of cancer indeed have dramatically improved:



Not listed: The 10-year survival rate for all forms of lung cancer into the 2020s only is about 10%, so even though the incidence has gone down dramatically, it remains a major killer.

From this we also have to draw a conclusion that many readers already likely suspected: while mortality rates are going down due to (often dramatically) higher survival rates, the overall incidence rate for cancer

is not exactly falling. In fact, despite cases of lung cancer - the number one killer for decades - having dramatically fallen since the early 1990s (since 2002 for women), the overall cancer incidence rate today still is somewhat higher than it was in the 1970s. This means that cancer forms other than lung cancer have been increasing. And that probably explains reports like these, which may well be linked to our modern sugar, artificial sweetener, and seed oil-soaked food chain:

> *"Based on our data, the predicted incidence rate of colon and rectal cancer [CRC] in 2030 will increase by 90% and 124% in patients aged 20 to 34 years. ... A 1.5% per year increase [or 25% total] in the incidence of CRC ... from 1992 to 2005 aged 20 to 49 years of age has been previously observed. ... Similar results have been observed in young women with breast cancer."*[5]

Appendiceal cancer, a rare form of colon cancer, *"tripled among those born in 1980—and quadrupled among those born in 1985—compared to people born in 1945."* [6] Suspicions, as always, have included ultra-processed foods as seed oils, sugar, sugar replacements, antibiotics in food, and possibly microplastics.

Looking at the incidence rates, it looks as if cancer, besides lung cancer, isn't actually being cured at the root cause. It is just preventively screened for and better treated, guaranteeing pharmaceutical companies and health care professionals a nice, stable income. But we'll get back to the money aspect at a later stage.

CANCER METABOLICS

Erasmus University Medical Center oncology course omissions: cancer cells use 200x more glucose than healthy cells: DNA over cancer cell metabolism

In 2010, for a few extra points for my physiotherapy education, I did a "tumorbiology" (oncology) course at the Erasmus University Medical Center. It's a prestigious university in the Netherlands. Anno 2024 it is ranked number 47 in the world in clinical and health sciences, and number 22 in business and economics. [7] I also ended up with a decent grade for the oncology class: an 8.

Despite that, I couldn't help but feel that students weren't getting a lot of practical knowledge - unless they eventually were looking to make money with either prescribing or developing anti-cancer drugs or gene therapies. So in that sense I was quite disappointed. You mainly just take courses like these for "prestige". Or, like me, because you're one of the last

to pick one of these extra courses, and all the "meditation" and "guitar lesson" classes are filled up...

To cut right to the chase, here's what I definitely was NOT taught during the Erasmus University Medical Center's "tumorbiology" course:

1. Higher sugar intake is statistically linked to higher rates of all kinds of cancer, both in the West and Third World where sugar was introduced at a later stage. [8]

2. In 1922, a hyper-obscure professor named "A. Braunstein" discovered that diabetes patients, who can't process glucose without external insulin, in the presence of cancer in their body, all of sudden showed zero glucose in their urine. [9]

3. This coincided with the much better known work of Otto Warburg, who in the 1920s discovered that cancer cells prefer glucose as fuel under all circumstances, even when oxygen is present. This became known as the Warburg Effect, and also as "aerobic glycolysis". [10] To illustrate better: Under normal circumstances with oxygen present, healthy cells make use of oxidative phosphorylation, a process up to 18x more efficient in producing energy in the form of ATP. Glycolysis, ordinarily reserved for environments without oxygen, is a much faster way of generating energy though, which is why cancer cells always prefer it. It allows them to multiply and spread faster.

4. Cancer cells use at least 50 to 100 times [11], and generally around 200 times [12], as much glucose (and glutamate) as healthy cells.

5. PET scans work so well in finding cancer, because they observe increases in (low radioactive) glucose absorption. [13]

6. The general idea is that cancer cells can't feed on ketones, the body's preferred fuel when it is starved from carbohydrates. [14] Hold that thought though.

7. Already in the early 1960s, the ketogenic diet - which uses almost no carbohydrates - has been shown to either slow down, and at least sometimes fully reverse, the spread of cancer. [15]

8. Unfortunately, in more recent times evidence - both in studies and YouTube videos of cancer patients - has been emerging that various cancers can adapt to consuming ketones. The best-known example of this is brain cancer, but this is not the only type. In brain cancer the ketogenic diet still has some result, as longer survival times have been reported than in people sticking to an ordinary diet in roughly 75% of cases. [16] As for those who react positively to the ketogenic

diet, at least one modern study on lab mice showed that it didn't extend survival time in brain cancer beyond 10%, or 25% in combination with a drug, due to *"drastic metabolic remodeling in the tumor."*[17]

In other words, the ketogenic diet has its place. But we need a lot more studies involving A) the exact food consumed; B) on what cancers it works and doesn't work, and to what extent; C) in what stages it has what amount of effect; D) and what drugs or other practices make it more potent.

9. Not only have an increasing amount of people reported that fasting helped stop or shrink their cancer (or their dog's cancer), but in particular a lot of people claim that fasting for 48 hours before chemotherapy, and for 24 hours after, enormously helps reduce the side effects of chemotherapy. In fact, at least one study in mice showed that only 25-33% of the damage was done to healthy cells when fasting. [18]

10. Oncolytic viruses - engineered or naturally occurring viruses that prefer to infect cancer cells - are *"much more effective at attacking cancer cells"* in environments with less glucose. [19]

11. Tumors are surrounded by a "stroma": semi-healthy cells that are manipulated by the tumor to do its bidding. This includes changing their energy metabolism from the efficient oxidative phosphorylation to the same aerobic glycolysis as just discussed with the Warburg effect. The glycolysis, while inefficient, can produce more energy quicker, and creates lactate as a waste product, which is absorbed by nearby cancer cells to further ramp up energy production.

12. The process of gluconeogenesis, through which cancer cells are able to generate glucose from non-carbohydrate substrates as amino acids as alanine and glutamine, fats, lactate and acetone.

13. An explanation why Coca-Cola and cookies often are given to patients in hospital during their chemotherapy treatment, with the above knowledge in mind, maybe should be provided by the anti-cancer authorities.

14. Tumors have the ability to nullify "helper" and "killer" T-cells that try to destroy the tumor by creating a microcosmos around it that involves *"molecules that can disable T cells, low oxygen, and a lack of nutrients for energy."*[20]

15. To varying degrees tumors have the ability to nullify "helper" and "killer" T-cells that try to destroy the tumor by sucking up their mitochondria - the energy plants of cells - through nanotubes, and then have these mitochondria work to produce energy for the cancer. The more mitochondrial receiver cells a tumor has, the more aggressive it tends to be and the quicker it kills the host. [21]

16. The different stages of cancer - stage 0 to 4 - also weren't mentioned in the course, which is an interesting omission as well.

Interesting facts, no? Some additional details and sources are to be found in the 'cancer: general' section. We all know about DNA defects, radiation, asbestos, about "fat being bad" - but I sure haven't found anyone in my immediate surroundings anno 2024 who knew any of the above facts. And we're talking knowledge that sometimes is over a century old. Looking at how obscure some of these facts are, including the exact amount cancer cells digest glucose in relation to healthy cells, it appears a lot of oncologists also don't know, and don't care.

What *was* taught?

So, what were we taught in this oncology course at Erasmus University Medical Center? Let's see, because I still have all the personal summaries and papers associated with the course. Going through it, it is all about RNA, DNA, other aspects of cell biology, different types of cancers, solid and non-solid tumors, terms related to statistical data, etc. As for causes of cancer, food isn't even mentioned. With regard to "exogenous" causes of cancer, "viruses" are mentioned (which seemingly only involves the Rous sarcoma virus), as are radiation and chemicals. Soot and asbestos are singled out as examples of the latter case.

That's it, but what is funny is that I clearly remember the lecturing professor - while discussing "exogenous" causes - saying to the students that, *"It is estimated that about one-third of cancer cases are linked to our diet."* That peaked students' interest, including mine, but the professor didn't elaborate and it wasn't part of the curriculum. At least not for the first 5 of the 6 weeks.

Only in the very last class, the food aspect was mentioned, and only when specifically dealing with colon cancer. This by definition is not giving the right picture, because high sugar intake increases the risk of all kinds of cancer, not just colon or rectal cancer. But students didn't even need to worry about sugar, because sugar wasn't even listed as a cause of cancer. Only the following food was listed:

1. Red meat.
2. Processed meat, as ham and salami.

3. Smoked meat (benzopyreen and such).
4. Burned fat.
5. High fat consumption.
6. Alcohol.
7. Aflatoxine.
8. Food additives as nitrosamines.

This, of course, is largely known, at least on a basic level without all the exact names of food additives and organic compounds. This information has been in the media plenty of times. No statistics were mentioned in relation to these risk foods, so this information didn't add much to anyone's knowledge. Only in the last minutes did the entire course get interesting, when the following foods were mentioned as being "cancer preventative":

1. Fiber, "especially found in vegetables and fruit".
2. Vitamin A.
3. Vitamin C.
4. Selenium.
5. Red wine.
6. Various substances: lycopenes from tomatoes, "compounds" in onions and lettuce/cabbage types.

All of this is true, and it might be interesting to know for readers that this information was part of an official tumorbiology course at a leading cancer research university. However, after this little list of cancer preventative natural compounds was dropped on people's laps, without further details or questions being asked about it at the exam, it was "Thank you!" and "Goodbye." Quite similar to the professor mentioning that diet is strongly linked to cancer, without elaborating.

Of course, it is ridiculous that the sugar and glucose effects mentioned in the beginning of this section were completely shunned from this oncology course at a leading cancer research university. We have to assume that someone with a lot of influence didn't want that knowledge in there. Since the international antifa protests, not just in the United States, but also right here in the Netherlands, we can see - or, better, this author could see - just how tightly university leadership is tied into the globalist movement. ISGP's old Pilgrims Society article already showed as much. So it is not at all odd to find out that university leadership is bending to the will of globalist multinationals - who often sponsor university programs and said activists - to make sure to leave out "unverified" information regarding cancer, sugar, and anything else unwanted. Suspicions about artificial sweeteners and seed oils weren't mentioned either, for example. Indirectly these multinationals influence successive government administrations through groups as Bilderberg and Davos.

CANCER CURES

Highest success natural cancer cures: all kill glucose-uptake of cancer, and attack it

Basically this author has seen four types of natural therapies that have (very) regularly resulted in people curing themselves, or their animals, of late stage cancer:

1. Fenbendazole, a cheap dewormer drug for animals, which in at least one study on lab mice was turbocharged against injected cancer cells by adding additional vitamins. [22] For most, it has almost no side effects. It works in at least four ways, which are quite similar to how fenbendazole kills worms in the intestinal tract:
   - It prevents cancer cells from taking up glucose.
   - It kills cancer cells' microtubials, preventing the cells from replicating.
   - It stimulates the production of new, healthy tumor antigen p53, which kills cancer cells, but *"is mutated in about 50% of cancers."*[23]
   - It stimulates the DNA repair gene P21. [24]
2. Gerson Therapy, a form of veganism, but mainly very strictly on the raw vegetable side.
3. Ketogenic diet, and then mainly with considerable focus on raw vegetables and natural cancer-fighting root vegetables and spices.
4. Fasting, in combination with the above diet. It activates the bodies autophagy system that attacks all unhealthy cells.

Follow the **Cancer: General** and **Fenbendazole source material** here for sources on all of the information here.

To summarize, the first two methods, as far as I personally have gathered, have the highest number of success stories, to the point it really blew my mind how easy so many success stories could be found. Fenbendazole, for example, hasn't been a success story for everyone, but there are few (natural) supplements that can even come close to the number of glaring success stories I saw on it, compared to "it does nothing for me"-stories. Fenbendazole almost fully keeping injected cancer cells in lab mice (in questionable health) under control, after the adding of a few extra vitamins; and sending 3 of 3 human test subjects into full cancer remission in a small 2021-published study, only adds to its credibility [25], if the 2019-aired Joe Tippens television segment, which included a credible cancer researching doctor confirming his story, wasn't enough already. In short, it was breathtaking to gather all the success stories and go over some of these studies.

Gerson Therapy-esque success stories really surprised me in number too. I haven't really formed a full opinion about it though. I'd say there are way too many success stories of people curing their cancers with pure vegetable consumption, to dismiss it. And it fits with other therapies and data.

The other two therapies have worked as well, certainly together. However, protocols, especially with raw vegetable and herb use, and fasting abilities, vary (it's easier for an overweight person than an already skinny person), and it is considerably harder to find a lot of success here. The stories that are there, are very convincing though.

Most people also haven't combined these methods. Certainly I have not seen anyone yet who has done a strict Gerson-type vegetable diet in combination with fenbendazole. Or maybe a little bit of meat and fasting mixed in, to see what ratio of meat and vegetable works the best. Some of these therapies only became more well-known in the late 2010s and throughout the 2020s, so there is still much to be learned.

None of these therapies actually are in conflict with the scientific information presented in the previous section. At the very least, all of these therapies starve cancer cells of their beloved glucose, opening the door for anti-cancer properties of vegetables, root vegetables and spices to better do their work - apart from the body's own autophagy process. Hence, it is also not in conflict with the oncology course at the Erasmus Medical Center, which side-stepped anything having to do with glucose, but didn't oppose it; and for the rest superficially admitted the cancer-fighting potential of vitamin A, vitamin C, onions and tomatoes.

CANCER PROFITS AND PHILOSOPHY

Why prevent or cure cancer? With over $300 billion in revenues for chemotherapy drugs alone?

So we have oncology educations and science sidestepping anything related to sugars and cancer for about a century now. What they should have been reporting since the 1920s - namely that cancers use about 200x the glucose than healthy cells - a handful of studies only have been doing since roughly the 2020s. Diets, fasting, and a cheap drug named fenbendazole, all of whom prevent cancer from taking up sugar, among other pathways, have all been ignored for decades. All of these therapies have barely even really been attacked. Not in a direct matter at least. They're just ignored.

At least thousands of people online tied into these natural treatments, suspect it is because multinationals make a lot of profit, with the finger

generally being pointed at food, insurance, and especially pharmaceutical companies. The general accusation in YouTube comment sections in particular is that there's no money in a cancer cure. Why not see if there is some merit to these accusations?

First question: who invented fenbendazole in the early 1970s? That turns out to be the Belgian firm Janssen Pharmaceutica, owned since 1961 by the American pharmaceutical giant **Johnson & Johnson**. The major Panacur-brand distributor since at least 2010 has been **Merck**, another American pharmaceutical giant. As already mentioned in a previous section, both of these American corporations are among the most frequently listed pharmaceutical firms donating to globalist think tanks as the CFR, Trilateral Commission, and Davos.

It's perfectly logical to ask: why don't these corporations finance research to prove Fenbendazole is as effective an allround anti-cancer drug as at least hundreds of people online are claiming? And various studies show? Why are they not analyzing why for at least some people Fenbendazole did not work? Why are they not trying to improve on fenbendazole's anti-cancer effectiveness? Why are they not immediately setting up clinical trials with the following test groups?

1. A control group without any treatment (immoral and unnecessary with humans, even more so working with placebos).
2. Fenbendazole.
3. Fenbendazole, plus extra (natural and-or synthetic) vitamins and minerals.
4. Fenbendazole, plus extra vitamins and minerals, plus anti-cancer vegetables and supplements (turmeric, garlic, etc.).
5. Fenbendazole, plus extra vitamins and minerals, plus keto diet.
6. Fenbendazole, plus extra vitamins and minerals, plus keto diet, plus fasting.
7. Keto only.
8. Fasting only.
9. Keto and fasting only.
10. Fenbendazole, plus Ivermectin, as people widely report anti-cancer success with this as well.
11. All the above, plus chemotherapy and/or laser treatment.
12. Etc.

Let's be serious: wouldn't this be the "weirdest" cancer study ever? Of course it would be. It would be something called "practical". And it would have to come from a government, or some wealthy individual, or someone completely away from the (lobbying) influence of pharmaceutical companies. Because why would pharmaceutical companies do a study like this? Why would they promote healthy eating,

(natural) vitamins, and a half-century-old drug that costs pennies to fabricate?

That's not a dig at the pharmaceutical companies or capitalism. It's just reality. If I was Bill Gates-wealthy, I would first get rid of all my stock in pharmaceutical companies and maybe related insurance firms before announcing I would do or support studies like these.

The fact is that every chemotherapy session produces roughly $100,000-$150,000 in revenues for drug companies, with insurance companies and many oncologists, through "markups", prescribing extra expensive "brand" chemotherapy drugs over "generic" ones. Even when UnitedHealthcare increased $12 markups for generic cancer drugs to $500, it didn't change a thing, because prescribing "brand" cancer drugs netted oncologists up to $1,400. [26] The "brand" medicines also have a habit of being 3.5 to 20x overpriced years after first development. [27]

These practices appear to be a huge burden on the healthcare system, and at least one reason why universal healthcare is becoming increasingly impossible to maintain in many western countries. Apart from citizens having to pay for these "brand" medicines through ever higher monthly insurance costs and higher "own risk" barriers (a Dutch term for the amount you have to pay yourself, before insurance starts to cover the costs for the rest of the year in question), imagine not having medical insurance at all, as often is the case in the United States... If you have no insurance or little money, with their being a major "own risk" barrier, you often delay diagnosis until it is too late. And when you go bankrupt during cancer treatment, you die:

> *"Cancer patients who go bankrupt are nearly 80 percent more likely to die than patients who don't."* [28]

We're not even talking about the horrendous side effects of chemotherapy and radiation, which are even worse than antibiotics. I personally have read plenty of stories ranging from people developing lifelong tinnitus because the inner ear has been damaged, to saliva glands having been destroyed, memory loss due to radiation or chemo ("chemo brain"), and new tumors developing due to the radiation treatment itself. In all fairness, not developing natural remedies, or further developing a highly effective, low side-effect drug as fenbendazole, or recommending that people fast before chemotherapy, makes the pharmaceutical industry a dark business. It's in the business of torture and death.

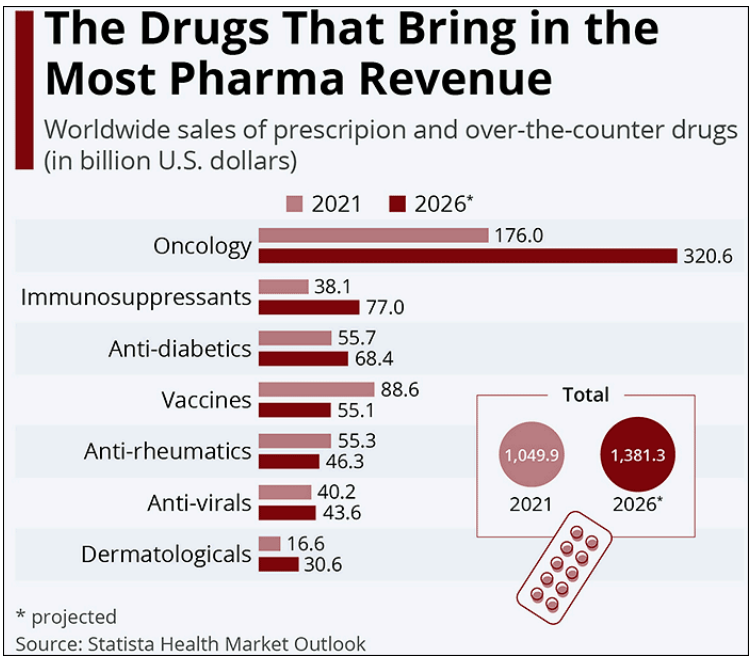
And we're not even talking about the demonstrated corruption in previous sections. The Vioxx Scandal alone demonstrates that big pharma companies as Merck and Pfizer, in collusion with the FDA, aren't

the slightest bit bothered with killing hundreds of thousands of people if that is what it takes to make a profit. The same goes for all the food and pharma companies littering the world with artificial sweeteners and rancid vegetable oils. It is hard to escape the conclusion that they all literally are in the business of death.

This business is lucrative though. In total, the oncology cancer drug market reached $147.2 billion in revenues in 2021, and has been expected to grow to an enormous $300 billion by 2030-2031. [29] In fact, many major pharmaceutical firms derive an ever greater portion of their revenues from selling chemotherapy drugs, including Johnson & Johnson and Merck. The following 2010-2019 study demonstrated exactly that:

	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019
J & J										
Total	26.3	27.7	28.2	30.9	34.9	33.9	35.6	37.8	41.5	42.2
Oncology	1.7	2.3	2.9	4.1	4.8	5.1	6.2	7.6	10.0	10.7
% Oncology	6.5%	8.4%	10.4%	13.4%	13.8%	14.9%	17.4%	20.0%	24.2%	25.3%
Merck										
Total	46.7	46.9	45.2	41.1	38.9	37.5	37.4	36.9	38.4	41.8
Oncology	2.3	1.8	1.6	1.3	1.0	1.5	2.4	4.8	8.4	12.3
% Oncology	4.9%	3.7%	3.5%	3.2%	2.7%	4.1%	6.4%	13.1%	21.9%	29.5%

And here are some more statistics:



So, as a preventive measure and because I'm a bit worried about potentially cancerous polyps in my colon without willing to spent a minor "own risk" fortune on a colonoscopy, I bought a two month supply of fenbendazole. Price? 37 euros for 30 pills, each with 500mg of fenbendazole. Add some (natural) vitamins and some fresh vegetables, both of which are more expensive than the drug, and you should have a decent chance of sending the worst of metastatic cancers in full remission, Joe Tippens style, with about 3 months of daily use. Add a little keto, add a little fasting, and a few anti-cancer supplements... and at the very least your chances of survival should be many times higher than what it used to be.

Saying this will probably mean I'll be dead in 3 months, but for the rest of the world: it should greatly increase your chances of stopping any cancer in its tracks and reversing it, with or without the help of additional traditional therapies.

Getting back to the profit aspect, when it involves multinationals financing the globalist movement, nothing ever is as simple as merely "profits". As indicated earlier, the globalist movement might well be Satan itself and operates as a global intelligence agency. It controls all media, all action groups, all national politics, from the "far left" ("liberal CIA" and antifa) to the "far right" ("conservative CIA") and everything more "mainstream" in between. In ISGP's "conservative CIA" article, for example, it has been documented how in the early 2000s Microsoft and Pfizer helped fund a William Buckley / "conservative CIA"-type controlled opposition network in the Netherlands.

Obviously, some kind of repression is going on. Somebody really doesn't want people to have cheap, basic cancer cures. Even fasting protocols

before and after chemotherapy, despite many people's extremely positive experiences and at least one major study on mice showing it limits healthy cell damage to just 25-33% of what it is without fasting [30], are not implemented. "Experts" know all about the studies in question, but are cited in (globalist) media outlets, even outside the U.S., coming up with excuses for people to not experiment with it:

> *"There are still just so many unanswered questions about fasting with cancer. ... Just because it works on mice, doesn't mean that this also goes for humans."*[31]

A decade after the study in question was published, crickets. No follow-up research, even though, theoretically, you'd think there would be an incredible rush to confirm if fasting also works for humans. But no, the research isn't done, or if it's done, it's dragged out over the decades.

After a while, you can only conclude that something, or someone, doesn't want a cheap, quick cure for cancer. Maybe we will hear more about the promising anti-cancer drug Dostarlimab of GlaxoSmithKline, which in 2022 was reported to have have cured every single colon cancer patient in its 18-person trial study. For the time being though, that drug costs $11,000 per dose, once again coming to a total of $100,000 per six months of treatment. [32] Not $80 to $300 for fenbendazole.

Are we ready for a cancer cure? Should we "drug" cancer away without addressing the underlying causes?

One additional thing that might be said is that maybe we are not ready for the "cancer cure". If our idea of "curing cancer" is to abuse our bodies year-in, year-out with bad artificial food, only to expect to take a "magic pill" and be "cured", then maybe we don't deserve a cancer cure at all. We really have to look at both prevention and curing in the same breath. Treating symptoms really is not a good way to go about things. That goes for many chronic diseases: diabetes, heart disease, some forms of arthritis, etc.

Don't get me wrong. I'd be very much relieved if tomorrow there is a cure-all cancer drug pill without too many side-effects. But if people start to rely on that, it could be dangerous for the development of the human gene pool. There's a reason why people in Africa tend to be lean and muscular. It's because they are benefiting from their ancestors having moved their bodies a lot, and having eaten certain ways.

If we start sitting in cubicles at work, move around in electric vehicles, sit in front of the computer and TV when at home, and on top of that eat boatloads of sugar, artificial sweeteners, and rancid fats, the bodies and genes of our children and grandchildren are going to reflect that. In fact, sucralose alone has already demonstrated to affect the gut microbiome of

offspring, and even myopia - a huge, emerging global crisis - has genetic aspects. So you can't fix situations like these with a "magic pill". We've got to look at our way of life in general.

Maybe an anti-caner pill, or anti-diabetes pill, might not be as imminently dangerous as finding a "cure" for the radiation of atomic bombs. But long term, there are many risks.

SOURCE MATERIAL

Cancer: natural cures summary and sources

- Cancer stages:
  - **Stage 0:** Carcinoma in Situ or pre-cancer. Abnormal cells are present but have not spread to nearby tissue. Often considered pre-cancer and generally highly curable through surgery.
  - **Stage 1:** A small, local cancer.
  - **Stage 2:** A larger cancer that has spread to surrounding tissue.
  - **Stage 3:** A larger cancer still with more regional spread, also into the nearby lymph nodes.
  - **Stage 4:** Metastatic cancer. I.e., it has spread to other parts of the body.
- Steps to prevent, halt, and cure cancer, as discussed in more detail and sourced below:
  - Remove vitamin and mineral deficiences and increase them over the bare minimum.
  - Include "vitamin U" vegetables.
  - Include natural cancer-fighting supplements and foods (vegetables/spices).
  - Include fenbendazole.
  - Remove all refined and artificial sugars, as well as all artificial food (heated vegetable oils, etc.).
  - Go on a ketogenic diet, but make sure to include a maximum amount of fresh (cancer-fighting) vegetables and spices, and eat biological meat and dairy. Maybe experiment with cutting out dairy.
  - Do fasting to induce autophagy (an additional step beyond just ketogenic diet).
  - Fasting before and after chemotherapy to greatly reduce its detrimental effects.
  - If fenbendazole, plus keto (with lots of raw greens/spices), plus fasting still doesn't work, do full Gerson Therapy (only fresh greens).

    - If you get Gerson Therapy to work, introduce 10-20% meat if you will, or maybe nuts, and see if it continues to work. If that works, you can try 40-50% non-greens. If this works, it's great because juicing and eating 8-18kg a greens a day can be extremely tedious.
    - Possibly play with a glutamine blocker.
- Do bloodwork to make sure you have no vitamin or mineral deficiences. You want your immune system working and testosterone levels up.
- Make sure to have a decent vitamin D level and a decent level of "zinc" and some natural vitamin C to optimize the strength of your immune system. NAC might be a great preventative choice too.
- Make sure that you have enough magnesium, because this mineral is strongly involved in preventing genetic mutations - which could lead to cancer.
- Eat a lot of "vitamin U"-containing vegetables as cabbage, kale, carrots, and especially spinach, because these are known to quickly heal the stomach lines and have various cancer fighting effects on top of that - without feeding much sugar to the cancer. With use of carrots, pretty decent-tasting smoothies can be made from all these vegetables, even without the use of fruits.
- Once or twice daily ingest fresh garlic, onions, and supplements as turmeric, DIM, wormwood, and NAC, because these are some of the more cancer-fighting supplements.
- The (still) relatively cheap dog dewormer Fenbendazole seems to be able to cure all kinds of endstage cancer in cats, dogs, and people - judging by the countless online testimonials. In other people, at least at lower doses, it halts the growth of the cancer.
- Get rid of sweets, and certainly once you have cancer, of all sugar/carbohydrates, because that is exactly what cancer feeds on, and is also one of the ways Fenbendazole stops cancer. Many or most cancer cells cannot feed on ketones, but healthy cells always can. It is interesting just how long it took for this author to get any decent sources one exactly how much more sugar cancers use. Turns out, the reported range goes from 50 to over 200 times. It's incredible that this is such obscure information, despite PET scans being used to find cancers based on glucose consumption:
    - webmd.com/cancer/features/cancer-sugar-link (accessed: May 31, 2024; "Medically Reviewed by Laura J. Martin, MD, MPH on July 10, 2023 Written by Linda Rath"): *"Cancer cells use about 200 times more than normal cells. Tumors that start in the thin, flat (squamous) cells in your lungs need even more glucose to fuel their growth."*
    - July 31, 2018, BMB Reports of the Korean Society for Biochemistry and Molecular Biology, 'Cancer stem cell metabolism: target for cancer therapy': *"While cancer cell*

metabolism does not efficiently produce ATP, it allows cancer cells to rapidly divide and grow. Consequently, cancer cells produce a substantial portion of their energy from aerobic glycolysis which is more rapid than OXPHOS, although the aerobic glycolysis is considerably less efficient in terms of the amounts of ATP produced per unit of glucose consumed. This inefficient metabolic process is useful for producing the nucleic acids, amino acids, and lipids necessary for rapid cell growth via glycolysis and OXPHOS intermediates (8, 9). To compensate for this inefficient metabolic process for energy production per unit of glucose consumed, cancer cells uptake glucose and glutamate at a rate of more than about 200 times that of normal cells."

- April 2022, Biochemie, 'Glucose deprivation using 2-deoxyglucose and acarbose induce metabolic oxidative stress and apoptosis in female mice bearing breast cancer': *"Cancer cells generate energy primarily by increasing the rate of glycolysis by 200 times that of normal cells of origin. ... This difference can be used as a target for cancer therapy by glucose deprivation."*
- Jan. 31, 2014, Lewis C. Cantley of Cornell Medical College, BMC Biology journal, 'Cancer, metabolism, fructose, artificial sweeteners, and going cold turkey on sugar': *"One example of a paradox from our research was the observation that pyruvate kinase, which is the enzyme in glycolysis that synthesizes ATP, actually tends to get turned down in cancer cells. This is paradoxical because cancer cells are typically utilizing glucose at 50- to 100-fold the rate of the normal tissue surrounding it, so why would they want to turn down one of the steps in that pathway and make less ATP? In the end, we figured out that it's because that allows the cells to use the intermediates in glycolysis for other purposes than just making ATP, such as making NADPH, or making ribose, or making serine or glycine [3]."*
- Feb. 2017, Federal Practitioner journal, 'Ketogenic Diets and Cancer: Emerging Evidence': *"In 1922, Braunstein noted that glucose disappeared from the urine of patients with diabetes after they were diagnosed with cancer, suggesting that glucose is recruited to cancerous areas where it is consumed at higher than normal rates. During that same time, Nobel laureate Otto Warburg found that cancer cells thrive on glycolysis, producing high lactate levels, even in the presence of abundant oxygen. Warburg conducted many in vitro and animal experiments demonstrating this outcome, known as the Warburg effect. ...*
In 1962 ... during 8 weeks of ketogenic dieting, 2 pediatric

female astrocytoma patients experienced improved mood and showed decreased glucose uptake on PET-computed tomography (PET-CT) of their tumor sites. One of these patients continued the diet and remained disease-free another 12 months.12 These early case reports provide compelling evidence for further research into the role of glucose metabolism in cancer treatment. ...

By the mid-20th century, KD use in epilepsy treatment and cancer research had waned. However, in the mid-to-late 1990s, with the establishment of the Charlie Foundation, the diet slowly started regaining recognition."

- cancer.gov/publications /dictionaries/cancer-terms/def/radioactive-glucose (accessed: May 1, 2024): *"A radioactive form of glucose (sugar) often used during a positive emission tomography (PET) scan, a type of imaging test. In PET, a small amount of radioactive glucose is injected into a vein, and a scanner makes a picture of where the glucose is being used in the body. Cancer cells show up brighter in the picture because they are more active and take up more glucose than normal cells do. When used with PET, radioactive glucose helps find cancer cells in the body."*
- Nov. 9, 2023, healthline.com, 'Can Antiparasitic Drug Fenbendazole Treat Pancreatic Cancer?': *"Fenbendazole ... has shown promise [and] may inhibit cancer cell growth and induce cancer cell death through various mechanisms, such as disruption of microtubule formation and inhibition of glucose uptake."*
- Oct. 3, 2022, Journal of the Egyptian National Cancer Institute, 'Why cancer incidence in the Arab counties is much lower than other parts of the world?': *"Fasting might also additionally lessen glucose levels within the blood, making it tougher for cancers to grow. Cancer cells feed on glucose, eating it at a far better degree than ordinary cells do. During fasting, one manner cells attempt to preserve strength is with the aid of using [sic] making it less complicated for cell membranes to metabolize insulin. This improves insulin's capacity to get rid of glucose from the blood. Reducing the glucose to be had to most cancers cells might also additionally restrict cancerous growth."*
- I haven't really seen a factual explanation at this point from authoritative sources dismissing the cancer - glucose tie. They deny ketogenic diet works, but the details in their explanations are lacking. While keto doesn't seem to cure (most) people of cancer, it does appear to considerably slow down the progression of the disease.

- cancerresearchuk.org/about-cancer/treatment/complementary-alternative-therapies/alternative-cancer-diets (accessed: May 25, 2024): *"Early (preclinical) studies showed that some cancer cells can't use ketones as energy. So, changing the diet to be high in fat and low in carbohydrate will lower glucose levels and starve cancer cells. Normal body cells adapt and can use ketones to survive. But these are early studies which are mostly in animals."*

- Move as much as possible towards a Ketogenic Diet, in which you start burning fat-based ketones instead of carbohydrates/glucose for fuel. As said, many cancer cells cannot feed on ketones, but healthy cells always can. Just making this dietary switch seems to prolong life, sometimes by 50-70%, thus giving anti-cancer treatments (much) more time to work. It seems the ketogenic diet cannot be relied upon by itself to reverse the cancer. Sometimes it may decrease or fully reverse it. Other times it will just slow down the cancer's progression. In fact, if you have a glioma (brain cancer), you have a type of brain cancer that can switch to consuming ketones - and there seem to be more of those type of tumors. In 75% keto still slows down progress though in case of brain cancer. [33] Adding something as fasting, various supplements, or Fenbendazole seems to be key.
  - Oct. 1, 2014, International Journal of Cancer, 'Ketone supplementation decreases tumor cell viability and prolongs survival of mice with metastatic cancer': *"Previous studies indicate that unlike healthy tissues, cancer cells are unable to effectively use ketone bodies for energy. Furthermore, ketones inhibit the proliferation and viability of cultured tumor cells. ... Mice were fed a standard diet supplemented with either 1,3-butanediol (BD) or a ketone ester (KE)... Dietary ketone supplementation with BD and KE prolonged survival in VM-M3 mice with systemic metastatic cancer by 51 and 69%, respectively ($p < 0.05$). Ketone administration elicited anticancer effects in vitro and in vivo independent of glucose levels or calorie restriction."*
  - Feb. 2017, Federal Practitioner, 'Ketogenic Diets and Cancer: Emerging Evidence': *"As early as 500 bc, fasting was used as an effective treatment for many medical ailments. Fasting continued into modern times, and in 1910, Guelpa and Marie proposed fasting as an antiepilepsy treatment. In 1921, Woodyatt noted that starvation or use of high-fat, low-carbohydrate diets in individuals with no significant medical comorbidities yielded acetone and β-hydroxybutyrate, 2 energy sources produced by the liver in the absence of glucose. A low-carbohydrate, high-fat diet was thought to be an alternative to*

fasting or starvation, having many of the same desired effects while continuing to nourish healthy cells. The term ketogenic diet (KD) was later coined by Wilder and Peterman...

When glucose is scarce, the body senses the need to make an alternative form of energy for cells. The liver then produces ketones and fatty acids, which provide for normal cells but do not benefit cancer cells. ... Ketogenic diets mimic the fasting state, wherein the body responds to the lack of glucose by producing ketones for energy. Excess lactate production, which is part of the Warburg effect, compensates for ATP production defects caused by dysfunctional mitochondrial oxidative phosphorylation.2,4 The resulting tumor dependence on glucose can be exploited with KD use. Ketogenic diets selectively starve tumors by providing the fat and protein that otherwise could not be used by glucose-dependent tumor cells. ...

In 1962, the New York Department of Mental Hygiene published an article about 2 women whose metastatic cancers disappeared after a series of daily hypoglycemia-induced insulin comas (brief and reversible). ... Their cancers (grossly visible cervical cancer and metastatic melanoma) became undetectable as early as 2 months into treatment. ... The patient had a radiographic response and good tumor control for about a year, before discontinuing the diet. She transitioned to chemotherapy, which included bevacizumab (antivascular endothelial growth factor), but the disease progressed and she died. ... In addition, during 8 weeks of ketogenic dieting, 2 pediatric female astrocytoma patients experienced improved mood and showed decreased glucose uptake on PET-computed tomography (PET-CT) of their tumor sites. One of these patients continued the diet and remained disease-free another 12 months.12 These early case reports provide compelling evidence for further research into the role of glucose metabolism in cancer treatment. ...

Conclusion: Data from case reports and trials suggest KD use is safe and tolerable for patients with cancer. Although it would be ideal to conduct a larger trial using a randomized therapeutic approach, the current emphasis on drug-based trials is a formidable obstacle. Other major obstacles are patient initiative and adherence."

- In contrast, at least one study makes the case that cancers grow 2.5x as fast and spread 10x as fast when fueld by ketones.

- L-Glutamine role in cancer proliferation (low in vegetables, high in meat and dairy - and maybe an explanation why pure keto doesn't fully stop cancer in many cases):

- Jan. 2018, Biomolecules & Therapeutics (Seoul), 'Targeting Glutamine Metabolism for Cancer Treatment': *"Glutamine is the most abundant amino acid in the blood and muscle (5) and is largely utilized for energy generation and as a precursor for the biomass required for rapid cancer cell proliferation (Windmueller and Spaeth, 1974). ... Most cancer cells are dependent on glutamine and cannot survive in the absence of exogenous glutamine, which has been termed "glutamine addiction" (Eagle, 1955)."*
- March 19, 2021, Sanford Burnham Prebys, 'Starving tumors by blocking glutamine uptake; Scientists have identified a drug candidate that blocks the uptake of glutamine and slows the growth of melanoma.'
- **Reddit comment:** *"central brain glioma, only otherwise ever confirmed in babies—in 2011, when I was 23. Still here, over a decade later, having had a noteworthy career. ... Tried fenbendazole: no difference. Now on Lamictal to block glutamate, and still seeing slow growth."*

- Do intermittent fasting or, if you have the fat, fasting for a few weeks, to induce autophagy - which is the body getting rid of damaged cells, including cancer. This is barely ever talked about, but it is stimulated by fasting. It is based on research by Yoshinori Ohsumi, and later also endorsed by Thomas Seyfried. The following post is extremely interesting and seems to indicate fasting by itself is at least as effective as Fenbendazole, or maybe even more effective when combined with a keto-diet:
  - **YouTube comment:** *"I've been treating my American Bulldog with fenbendazole for cancer. She was given 2 months to live by the Vet oncologist almost 4 years ago. She's been terminal with metastatic aggressive anal gland cancer but she doesn't know it. She gets full deworming dose of Panacur C 3 days on 4 days off. No side effects and perfectly healthy, except the tumor is still there. I don't bother with any tests or scans, just monitor the tumor and giver her Panacur and a bunch of anti cancer food and supplements. I also fast her 36-48 hours once a week. She does't like fasting but it shrinks the tumor more than anything. The Vet oncologist measures her tumor and tests her blood every few months. He doesn't treat her cancer but prescribes Gabapentin for her arthritis because she's 13.5 years old. He's so fascinated the she's still alive and doing well because dogs don't live with this type of cancer even with the best treatment more than 2 years. We tried a couple of chemo drugs but they didn't work. Fenbendazole works. Joe Tippins has the human dosage."*

- YouTube comment: *"My mom has stage 4 stomach cancer and has gone through all chemo therapy. She couldn't eat for 20 days and had toxic fluid in her stomach pumped out several times. She should be dead but miraculously she is getting better and i think it's because the tumors can't grow as fast bc she is 76 and she had not eaten. I think one can starve cancer of what it usually thrives on.... just a hunch."*
- Oct. 3, 2022, Journal of the Egyptian National Cancer Institute, 'Why cancer incidence in the Arab counties is much lower than other parts of the world?': *"Several mechanisms have been adopted to explain the significant decreased incidence of cancer in the Arab countries, among them fasting, food full of special recipes filled with spices, significant lower rates of smoking and alcohol drinking, and genetic predisposition. ...*
  The role of autophagy in cancer is complex and its function can vary from one to another: biological factors such as tumor type, stage of progression, and genetic status; oncogene activation and tumor suppressor inactivation, thus autophagy may be associated; and to prevent tumor formation or to enable adaptation, proliferation, survival, and metastasis of cancer cells [14]. Protocols aimed at inducing autophagy rather than blocking it are currently being intensively studied in oncology [15, 16] ...
  Fasting might also additionally lessen glucose levels within the blood, making it tougher for cancers to grow. Cancer cells feed on glucose, eating it at a far better degree than ordinary cells do. During fasting, one manner cells attempt to preserve strength is with the aid of using making it less complicated for cell membranes to metabolize insulin. This improves insulin's capacity to get rid of glucose from the blood. Reducing the glucose to be had to most cancers cells might also additionally restrict cancerous growth."

- Fasting for 24-48 hours before chemotherapy and 24 hours after also is key in greatly limiting its damage:
  - June 5, 2014, Cell Stem Cell journal, 'Prolonged Fasting reduces IGF-1/PKA to promote hematopoietic stem cell-based regeneration and reverse immunosuppression': *"Cycles of prolonged fasting (PF) reduce damage in bone marrow stem and progenitor cells and protect mice against chemotoxicity ... In agreement with our previous results with [chemotherapy drugs] etoposide and doxorubicin, we observed a significant protective effect of cycles of 48-hours PF against CP-induced mortality (Figure 1B and S1A) (Raffaghello et al., 2008)* ***[the graph in 1B shows 100% survival rate after 84 days versus just 42% for non-fasting group]****. The PF cycles also led to a decrease in the DNA damage caused by CP in leukocytes and BM [bone*

marrow] cells (Figure 1C and S1B). ***[damage in leukocytes seems to be 25-50% less; damage in bone marrow seems to be only 1/3rd to 1/4th]*** *...*

Prolonged fasting cycles regulate stem cell populations independently of chemotherapy and help reverse from immunosenescence [immune destruction and dysfunction]..."

- Persons who cured stage 3 and 4 cancer through diet - without Fenbendazole - include Fred Evrard [34], a French guy with last name "Guy" [35], Chad Hodge [36] and others. Interviews with them are to be found on YouTube. To do so they:
  - generally did traditional chemotherapy to reduce the size of the cancer;
  - didn't eat a single thing for 24 to 48 hours before the chemotherapy, and 24 hours after, to greatly reduce side effects;
  - rejected all other dietary advice or sugary sweets - such as Coca-Cola and cookies - given by doctors and nurses throughout the chemotherapy process;
  - did (intermittent) fasting to induce autophagy;
  - did a Ketogenic Diet devoid of carbohydrates;
  - ate a large amount of cruciferous vegetables, which we know, through "vitamin U" can cure intestinal ulcers in a matter of days;
  - ate raw garlic, known to fight cancer. (they didn't seem to know about the other anti-supplements here)
  - **FredevrardAcademy YouTube comment to Gerson Therapy success story:** *"Fantastic. It's great to know they're more of us. I cured a stage 3 colon cancer with a 21 day fast, juicing, and a strict, organic ketogenic diet (but I including organic, grass-fed meat). Four months later, I was 100% cancer free."*
- Gerson Therapy is an interesting one. It claims to be particularly effective for the following cancers: lung, colon, breast, lymphatic, ovarian, and prostate cancer. It claims to be largely ineffective against the following cancers: bladder, bone, brain (or metastases to the brain), endometrial (uterus), kidney, thyroid, testicular, and pancreatic cancer, as well as leukemia and multiple myeloma (even more since discontinuing "raw liver juice"). [37]
- One 2009 study is regularly brought up as proof that "Gerson Therapy" doesn't work, as it killed patients in 4.5 months versus 14 months for chemotherapy. However, this was a test of Gonzalez Therapy. [38] This protocol is quite different. It has vegetable and fruit juicing and the peculiar coffee enemas in common. But the Gonzalez Protocol can include "red meat". Mainly it is heavily focused on Gonzalez's "pig enzyme therapy", which has zero place in Gerson. A similarly frequently-cited subsequent "scientific" review of the same

study in 2010, entitled 'Gerson Regimen', in which Gerson Therapy is summarized as being *"closely related Gonzalez therapy"*, isn't overly useful in that regard either. [39] It also appears Gonzalez, whose early work was funded by top globalist food firms Procter & Gamble and Nestle [40], never exactly produced miracles with pancreatic cancer therapy: *"Among 11 patients with inoperable, biopsy-proven, stages II to IV pancreatic adenocarcinoma, he reported 81% survival at 1 year and 45% at 2 years. [3] Four of the 11 patients survived for 3 years."*[41]

- Eric Ewing below indicates that at least the core of of Gerson Therapy does work.
- Looking at the Gerson Therapy protocol, designed in the 1930s and seemingly kept close to its original formula, it includes raw and cooked vegetables. It also allows daily consumption of fruits, dried fruits, potatoes, 1-2 slices of rye bread, plain yoghurt (after 6-8 weeks), and weekly consumption of brown rice (with permission) and sweet potatoes. The following heavy duty sugar-containing foods also are allowed: *"maple syrup (grade A dark color — formerly grade B), honey, brown sugar or unrefined blackstrap molasses — 1–2 teaspoons (15–30 ml) of any per day, maximum.* At the same time, spices, which can be very beneficial, are not emphasized: *"only small amounts."*[42]
- In contrast, when we look at modern people having cured their cancer, regularly apparently without surgery or chemo, and even when they refer to Gerson Therapy, they mostly only talk about having cut out carbohydrates and only, or mainly, eaten vegetables. This is tough to do. You need to eat about 12kg of carrots, spinach, or lettuce for 2,800 calories compared to 1.5kg of pork shoulder carbonade. Because of this discrepancy, it doesn't seem to matter matter that vegetables have about 1/5th the L-glumatine, which cancer loves besides sugar, because in the end you might well up with more L-glutamine when you eat 10x more of them in a day. You also get a lot more sugar, which cancer lovers. So with Gerson Therapy you may not so much starve the cancer better than with keto, but the active cancer-fighting properties of vegetables might come more into play. Alternately, some people the diet's restriction of methionine is a (another) key factor in killing cancer. Hard to say.
- Experiences:
  - July 7, 2018 YouTube upload by 'KCTV5 News' (Kansas, owned by Gray Television, Inc.), 'Lee's Summit man used food as medicine to fight Stage 4 cancer' (Eric Ewing October 2016 was diagnozed with stage IV skin cancer in Oct. 2016. He only shows himself with vegetables, including huge amount of carrots. IG: @stage4ninjawarrior): *"**[ERIC EWING:]** [The suggested chemotherapy in reality] didn't increase your chances of survival by 1%. [So] I went guns a-blazing with the*

Gerson Therapy. ... It's eating whole plant-based foods and juicing 13x a day for 2 years.... So every hour, on the hour, from the time that you wake up to the time you go to sleep, you are making a juice. And you do that for 2 years. ... Tumor number 13 is the only one left, shrinking in my left lung. ...

[Narrator:] *[Gerson Therapy] also means no more dairy, meat, sugar, alcohol, or processed foods. ... Dr. David Clark is the naturopath that Eric has worked with locally for his supplements. He has watched as Eric's tumors have disappeared, one by one. The Gerson Therapy now also is the focus of a new therapy called A Food Cure, just released in California three weeks ago. It follows 6 cancer patients at varying ages through their fight. ... And I have great news to pass along: Eric just had another scan and learned that 13 and final tumor is now officially gone. He is now tumor free."*

- YouTube comment: *"I have stage 4 metestatic breast cancer (over 5 years) and have never felt better! I agree with the vegetable thing....I eat greens before each meal (about 2 lbs [900 grams] per day) not as much as this [Gerson] guy, but my scans are showing the cancer hasn't moved in over the 5 years."*
- YouTube comment: *"I did Gerson for 1.5 years for my cancer. I still haven't had treatment and am doing well. [I had] non-Hodgkin lymphoma. ... I believe it helped my immune system strengthen to fight this disease. I now follow a whole food plant based diet and continue to do well and live a normal life. I finished Gerson about a year and half ago, and highly recommend it for other chronic diseases too."*
- YouTube comment: *"I used Gerson, plus other natural therapies. I'm now 21 years past my 'use by' date. [Update after a dismissive, obsessive "skeptic:] I never had medical treatment. It's intriguing why you are so terrified of natural good health that you attack my character."*
- YouTube comment: *"My friends husband was diagnosed with stage 3 cancer so he started this juicing diet and it worked! It's been 8 years since his diagnosis and he is now cancer free. I have to say that he has really strong willpower and continues to juice and eat organic."*
- YouTube comment: *"I am a tremendous skeptic in complete defiance. My sister treated her GBM-4 with Gerson and macrobiotics - she was given 2 months to live. Well, that was 5 years ago. She's healed and healthy in complete remission with food as her medicine. It's crazy."*
- YouTube comment: *"My wife stage 4 blood cancer survived due to her chance in diet. Basically 100% veg, complete plants*

based food, cold water towels kepts on her tummy for 15min three times a day. Apple, pinaple juice, etc."

- **YouTube comment:** *"My friend had prostate cancer and I went with him to the Gerson retreat and helped him to continue the treatment and he's now 4 years in remission."*
- **YouTube comment:** *"I knew a man who was given six months to live and he went to the Gersen Clinic in Mexico.....in the 70s...he lived over 40 years longer than he was supposed to live. His melanoma had metastisized to his lymph glands. I've eaten the way he taught me since 1986, but I haven't done the juicing like that. I have not had any sickness of any kind and I was sick all the time as a child."*
- **YouTube comment:** *"I did the whole plant food diet 43 years ago with bone cancer and colon cancer. I didn't do any treatments."* **Reply:** *"Exactly. My father had cancer and did the same. It does work for some people despite what Dr DUKE STEELE bleats on about. ... he trolled my comment I wrote about here before and in fact laughed about my father passing from Leaukemia. He's sick. [My father] used green juicing in conjunction with his medicine and went into remission. He lived an extra 25 years from his diagnosis."*
- **YouTube comment:** *"Love this, I actually had someone tell me about 4 years ago in Olathe Kansas that he beat his cancer like this as well - exact same treatment, juicing lots of fruits and vegetables."*
- **YouTube comment:** *"My sister had stages 4 cancer (removed 2 breast) and never had chemo or radiation except juicing green everyday 6 times a day she removed processed food, dairy, meat, and sugar in her life. She only eats veggies, fruits, high fiber food, vitamins and healthy low carbs, and exercise in her regimen it's been 12 yrs right now and she's healthy and live her life to the fullest."*
- **YouTube comment:** *"I knew a lady who did the Gerson treatment and had a relapse. She thought she was cured so she went back to eating dairy and other things and stopped juicing. Well, she lost the battle to cancer. Using Gerson treatments doesn't mean the cancer won't come back. You have to keep on the strict diet forever or the cancer comes back."*
- **YouTube comment:** *"I remember reading this girl's story from women's day magazine, she had lung cancer and never smoked. Determined to live for her kids she started juicing tons of green apples, some carrots. Unfortunately I don't have exact ingredients. If anyone knows the story, she did beat cancer from [the] article."*
- **YouTube comment:** *"This is true. My father was diagnosed with stage 4 colon cancer and given 6 months to live. I introduced*

him to my diabetic diet and advised him to only eat fresh or frozen. He lost 60 pounds and lived 6 more years."

- **YouTube comment:** *"My uncle of 54 have próstata cancer, Doctor prescribe quimio therapy, but he come to Mexico and go to an specialist in cancer, they changed his ways and no more beef prohibited no fryer chips, no Coca-Cola prohibited no sugar nothing on can, all green and freshly, now he is healthy, he is 64, no more Cancer (Recipe all days: 1 cup of water + 2lemon's juice) and remember no red beef."*

- Gerson Therapy-esque success (heated vegetables, mixed with raw):
  - **YouTube comment:** *"I did this [fasting] 22 years ago when I had cancer. Dinner was all steamed green. Veggies. I was also pregnant. Drs wanted to terminate. I stayed away from drs and my son is now 21. I'm still here and I still fast all day and only have dinner and don't have any issues."*
- Extra keto experiences:
  - **Reddit comment:** *"I am so sorry to learn of your wife dealing with cancer. ... My colleague had cancer and he decided to go for the KETO diet (which they say it doesn't work) and oddly before they could even get him into chemo-therapy, the cancer shrunk, and he went into remission.*

    It is my understanding he was very aggressive with the KETO diet and continued onward, until it (cancer) virtually disappeared from his body. The UChicago Hospital told him that he was a nutcase, belittling him.

    His job relocated him to Cleveland, so he went to Cleveland Clinic there, and they monitored him very closely for a long time before declaring that he was totally cleared of all cancer. The Professor (Oncologist) there studied him, and tried it on several other patients (because all other stuff failed) and was really impressed that the KETO diet worked very well for them too.

    KETO diet is not for everyone! My wife tried it for her bad foot, and it actually made it worse!" **The comment was to this one, with 30 upvotes, versus the previous comment with -4 total votes:** *"This [castor oil] stuff [with regard to absorbing toxins] is bullshit, but my wife is a cancer patient and things like this give her hope..."*
  - **YouTube comment:** *"My uncle was told by doctors when he was 21 that he wouldn't live to see his 30's if he didn't have his colon out. He had polyps and cancer in his bowel. He opted to change his diet instead. No processed foods, mostly veggies, some grass/grain fed meat, very little dairy. They couldn't believe when his scans came back clear a year later. He was*

super healthy until he went off his diet around the time he was 42... he died at 48."

- Nov 18, 2015 YouTube upload by 'WCPO 9', Starving away' cancer: One of our reporters tried it'.

- Whole food diet changes alongside chemo and-or surgery (less details):
  - **YouTube comment:** *"My uncle did the same thing. He ate raw vegetables to fight his cancer. The Doctor was surprised because he beat it."*
  - **YouTube comment:** *"3 years ago I had a tumor the size of a tennis ball on my left ovary and was in agony. I found an amazing holistic Dr who used Chinese herbs to shrink liquid from tumor and get me out of pain until I could have surgery at cancer center. Because of pandemic I could not get surgery for months. I ate clean and rid my body of sugar and it was the best thing I ever did for myself. There is something to be said about natural everything. I beat cancer and I am blessed beyond belief."*
  - **YouTube comment:** *"I had stage 4 colon cancer. I did have surgery....twice but no Chemo. According to my medical team that was a very bad move and perhaps it would have been if I didn't do anything and take responsibility but I did and changed everything. Not only food but all chemicals, no preservatives or processed food,water and looked at my emotional life and I'm doing great I will also add I don't battle cancer, I don't battle anything. That fear just made it harder so I stopped the fear and surrendered to the process I chose and focused on that. 3.5 years later I'm doing fabulously....and still eat an organic whole food plant based lifestyle."*
  - **YouTube comment:** *"This is very true, my friend was diagnosed with stage 4. She basically did the same thing. Fruits and vegetables. No meat, processed or microwaved foods. Her doctors were amazed. They thought it was the chemo and drugs. She didn't tell them what she was doing. She wasn't even taking most of the prescribed medicine. She didn't want to be discouraged. Her doctors were labeling her as a "miracle". They had basically counted her out. She was very disciplined. Now, IF this way of eating helped fight cancer, just imagine what else it could do. Just saying..."*
  - **YouTube comment:** *"One of my best friends was given 3 years to live with bladder cancer and by changing his diet to a similar one as Gerson he lived 17 years!!"*
  - **YouTube comment:** *"My sis was diagnosed breast cancer on 2005... had surgery... refused doing chemo and radiation... totally changed her diet... started exercising, meditation. Until today, May, 2023... she is cancer free..."*

- Vitamin C to beat cancer:
  - **YouTube comment:** *"I know of 2 people who beat late stage cancers using vit C dosages. One went to a mexican clinic for very wealthy people the other one dissolved vit C tablets in water in a gallon milkjug. He carried it with him, drank it constantly according to my friend. (i think it was lung cancer) I do not know how much, or how long he did this. But his "year to live" turned into another 20 years and he died of old age."*
- Ivermectin is often mentioned as aiding in the eradication of cancer:
  - **YouTube comment:** *"Since I have been treating my chickens with Ivermectin monthly, I have lost zero to cancers and those horrid respiratory infections. Just saying."*
- People being skeptical of Gerson (or vegetable only) and fenbendazole treatments being in (local) news. For Gerson it makes a degree of sense due to the globalist vegan agenda:
  - **4,800 YouTube likes:** *"Of course it's controversial among medical professionals [a person curing himself of stage 4 skin cancer with vegetables only]; they can't make any money off of it."*
  - **493 YouTube likes:** *"How was this even allowed on air? Big pharma didn't tell you you're not allowed to show people anything that doesn't enrich them??"*
  - **103 YouTube likes:** *"I'm surprised that they even ran this video knowing how backwards this world is."*
  - **57 YouTube likes:** *"I know someone who did this personally. I'm surprised its on the news."*
- Some chemotherapeutic agents come from natural compounds:
  - Dec. 8, 2023 YouTube upload by 'vlogbrothers' (a skeptical nerdboy ranting against alternative "natural" treatments], 'Did Natural Cancer Treatments Save My Life?': *"Three out of the four chemo drugs that I was on [for Hodgkin's Lymphoma (lymphatic cancer)], are natural. ... Vinblastine comes from the [extremely poisonous] Madagascar periwinkle. It is just in a cute little flower. It was known to the indegious people in Madagascar [Well, despite being poisonous, it was used in Ayurveda and TCM, apparently in the latter system for diabetes, malaria, and Hodgkin's lymphoma]. Scientists found it out it had a bunch of anti-cancer properties. Another one... Doxorubicin, was found in microbes in the soil of the base of an Italian castle [and is an antibiotic with cardiotoxicity]. The third, Bleomycin, was also found in a soil microbe called Streptomyces verticillus [which is an antibiotic or antibiotic-derived compound]."*

Cancer: colon

- Often the result of polyps that over the span of ten years turn cancerous.
- See 'Cancer: General', because it largely includes dietary advice that is of direct effect on the colon.
- NAC should definitely not be skipped as a prevention and potential cure, considering it can attack stomach infections, can lower high Proliferation Indexes of 45% to just 2% (the speed at which (cancer) cells divide), and possibly even lower at higher doses or longer periods; and results in at least a 50% reducation in polyp recurrance in the long run.
- The (very expensive) medical drug Dostarlimab is a very promising rectal/colon cancer medicine:
  - June 5, 2022, New York Times, 'A Cancer Trial's Unexpected Result: Remission in Every Patient': *"I believe this is the first time this has happened in the history of cancer," Dr. Diaz said. ... A complete remission in every single patient is "unheard-of," [Dr. Venook] said. ... Dostarlimab, known as checkpoint inhibitors. The medication was given every three weeks for six months and cost about $11,000 per dose. It unmasks cancer cells, allowing the immune system to identify and destroy them."*
  - June 5, 2022, New England Journal of Medicine, 'PD-1 Blockade in Mismatch Repair–Deficient, Locally Advanced Rectal Cancer': *"A total of 12 patients have completed treatment with dostarlimab and have undergone at least 6 months of follow-up. All 12 patients (100%; 95% confidence interval, 74 to 100) had a clinical complete response, with no evidence of tumor on magnetic resonance imaging, 18F-fluorodeoxyglucose–positron-emission tomography, endoscopic evaluation, digital rectal examination, or biopsy. At the time of this report, no patients had received chemoradiotherapy or undergone surgery, and no cases of progression or recurrence had been reported during follow-up (range, 6 to 25 months). No adverse events of grade 3 or higher have been reported."*
- Ivermectin might be useful:
  - Aug 13, 2021, Frontiers in Pharmacology journal, 'Ivermectin has New Application in Inhibiting Colorectal Cancer Cell Growth'.

FENBENDAZOLE

Anti-cancer studies

Fenbendazole is a powerful, low toxicity antiparasitic for dogs, cats and farm animals, developed in the early 1970s by a Johnson & Johnson subsidiary and today spread by Merck under the Panacur brand, that various modern studies show has serious potential as an anti-cancer agent.

- Nov. 9, 2023, healthline.com, 'Can Antiparasitic Drug Fenbendazole Treat Pancreatic Cancer?': *"Fenbendazole ... has shown promise [and] may inhibit cancer cell growth and induce cancer cell death through various mechanisms, such as disruption of microtubule formation and inhibition of glucose uptake."*
- Aug. 9, 2018, Scientific Reports - Nature, 'Fenbendazole acts as a moderate microtubule destabilizing agent and causes cancer cell death by modulating multiple cellular pathways': *"Fenbendazole [FZ] is a safe and inexpensive ... drug... In our earlier work, we reported a potent [cancer] growth-inhibitory activity of FZ caused partially by impairment of proteasomal function. Here, we show that FZ demonstrates moderate affinity for mammalian tubulin and exerts cytotoxicity to human cancer cells at micromolar concentrations. Simultaneously, it caused mitochondrial translocation of p53 and effectively inhibited glucose uptake, expression of GLUT transporters as well as hexokinase (HK II) - a key glycolytic enzyme that most cancer cells thrive on. It blocked the growth of human xenografts in nu/nu mice model when mice were fed with the drug orally."*
- Oct. 4, 2022, Plos One, 'Experience with and perceptions of non-prescription anthelmintics for cancer treatments among cancer patients in South Korea: A cross-sectional survey': *"This survey included 86 cancer patients, aged 19 years and older, who underwent anthelmintic therapy for cancer. They were recruited from two online communities in South Korea through a structured questionnaire that was provided online. Cancer patients under non-prescription anthelmintic therapy for cancer in South Korea were mostly in their advanced stages and had started the treatment in 2019. About half of the cancer patients had taken non-prescription anthelmintics during their chemotherapy, and 96.5% of them did not inform the clinicians. These participants had a positive perception (79.1%) toward the effectiveness of anthelmintics, as they felt it improved their physical condition. [Study doesn't mention survival rates]. ... Moreover, patients (3.5%) who informed their clinicians about the therapy reported that they did not receive their support."*

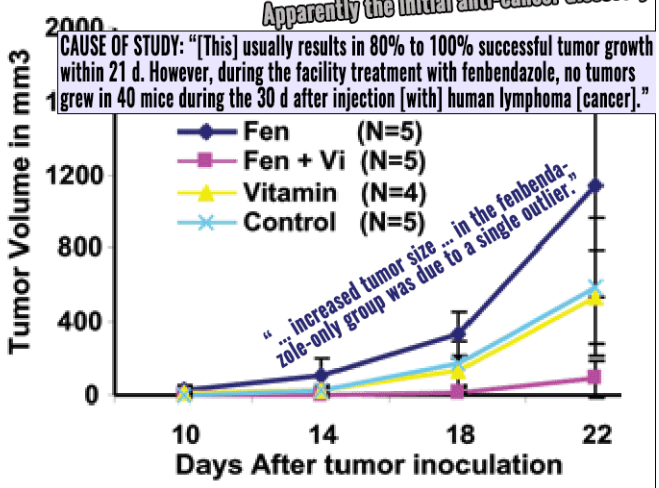
Few studies have been done on Fenbendazole as an anti-cancer agent, and fewer still have been real-world useful. As far as available studies go, it appears that a Nov. 2008-published study is the first to talk about this

connection, after the researchers by accident found out it suppresses tumors. The dose they used on the mice seems incredibly high, amounting to 15,000 mg of Fenbendazole for a 100 kg / 2020 lb person.

- Nov. 2008, Journal of the American Association for Laboratory Animal Science, 'Unexpected Antitumorigenic Effect of Fenbendazole when Combined with Supplementary Vitamins' (PDF):

Unexpected Antitumorigenic Effect of Fenbendazole when Combined with Supplementary Vitamins [in Mice]

Nov. 2008 | Journal of the American Association for Laboratory Animal Science



Apparently the initial anti-cancer discovery
CAUSE OF STUDY: "[This] usually results in 80% to 100% successful tumor growth within 21 d. However, during the facility treatment with fenbendazole, no tumors grew in 40 mice during the 30 d after injection [with] human lymphoma [cancer]."

K3	51	102	mg/kg	100
B1	16.5	117.6	mg/kg	613
B2	14.9	27.2	mg/kg	83
Available niacin	41.2	87.3	mg/kg	112
B6	18.5	26.8	mg/kg	45
Pantothenic acid	33	141.6	mg/kg	329
B12	0.08	0.15	mg/kg	88
Available biotin	0.3	0.82	mg/kg	173
Folate	3.34	8.41	mg/kg	152

The data shown are vendor-reported values.

ChatGPT comes up with 6 reasons why injected cancer cells in laboratory mice are much more aggressive and deadly than real-life tumors: 1) aggressive cell selection, 2) high density of cells, 3) artificial microenvironment: ... *"For example, subcutaneous injections (under the skin) provide a rich blood supply and space for tumor expansion"*; 4) lack of natural barriers, 5) immunocompromised mice, 6) inflammation at the injection site (or stress throughout the host).
However, one would think if a first test on these mice almost fully stops (injected) cancer growth in mice, that A) it wouldn't be hard to eventually keep the curve flat; and B) that a lot of additional attention would have been drawn to the drug, as well as vitamins. Online, there's an army of people talking about full reversals, so who knows how the lab situation with mice differs from humans in ordinary life.

"Pinworms are a common problem in rodent facilities4,16 and

typically are treated with anthelminthics. 17 Fenbendazole incorporated in the diet is used often because it is safe—the oral LD 50 for rats and mice is in excess of 10,000 mg/kg 5—and labor-efficient, and adverse effects in research rodents have rarely been reported.20 ***[Note: so why wasn't Fenbendazole's tumor-suppressing characteristics discovered/reported earlier?]*** *...*

This [method] usually results in 80% to 100% successful tumor growth within 21 d. However, during the facility treatment with fenbendazole, no tumors grew in 40 mice during the 30 d after injection. ***[Note: the study doesn't say how many mice were involved in this initial study that resulted in the effect.]*** *...*

To assess the role of fenbendazole and supplementary vitamins on tumor suppression, 20 vendor-supplied 4-wk-old SCID [Severe Combined Immunodeficiency Disease] mice were assigned to 4 treatment groups: standard diet, diet plus fenbendazole, diet plus vitamins, and diet plus both vitamins and fenbendazole. Diet treatment was initiated 2 wk before subcutaneous fank implantation with 3 × 107 lymphoma cells. Tumor size was measured by caliper at 4-d intervals until the largest tumors reached a calculated volume of 1500 mm3. Neither diet supplemented with vitamins alone nor fenbendazole alone caused altered tumor growth as compared with that of controls. However, the group supplemented with both vitamins and fenbendazole exhibited significant inhibition of tumor growth. The mechanism for this synergy is unknown and deserves further investigation. Fenbendazole should be used with caution during tumor studies because it may interact with other treatments and confound research results. ...

This study was in part supported by Leukemia Lymphoma Society grant LLS6175-08, NIH grant CA57341, and by Johns Hopkins Research Animal Resources. ...

Tumors in the fenbendazole plus vitamin group were significantly smaller (P = 0.009) and delayed in initial growth compared with those of the control group (Figure 1). Tumor growth did not differ between control and fenbendazole-only (P = 0.12) or vitamin-only (P = 0.82) groups. The apparent trend toward increased tumor size (P = 0.12) in the fenbenda-zole-only group was due to a single outlier. ...

This study demonstrated that a combination of supplemented vitamins and fenbendazole in the diet inhibited growth of a human lymphoma [lymph cancer] cell line in SCID mice, whereas fenbenda-zole or vitamins alone had no growth inhibitory effect. The mechanism for this synergy is as yet unknown. However, likeother anticancer drugs such as taxanes,14 quinolones,3 and vincaalkaloids,15 fenbendazole inhibits microtubule polymerization.In addition, fenbendazole is a member of a large

group of related anthelminthics, the benzimidazoles, and another member of thisgroup, mebendazole, exerts antitumor effects by inhibition of tumor-induced neovascularization.11 However, in the presentc ase, fenbendazole likely contributes to the antitumorigeniceffect through its antimicrotubule activity.

Supplemented vitamins included B, D, K, E, and A. Vitamins Eand A both have antitumor properties by virtue of their antioxi-dant properties. Vitamin E causes antitumor and antimetastaticeffects in several animal models of cancer; for example, it sup-presses the nuclear transcription factor NFκB in prostate celllines.13 NFκB regulates proapoptotic and prometastatic proteins;thus suppression results in antitumor effects. Higher intake ofdietary folate and vitamin B has been associated with lowerincidence of colorectal cancer in women. 22 Recent work sug-gests that hypoxia-inducible factor 1α (HIF), which plays a keyrole in tumorigenesis by facilitating adaptation to hypoxia, isdiminished by microtubule inhibitors, 7 and some antioxidantsmay exert their antitumor effects through reducing HIF ratherthan by reducing genetic instability.8,10 We hypothesize thatthe combination of fenbendazole and supplemented vitaminantioxidants may have exerted a threshold effect, resultingin reduction of HIF and inhibition of tumorigenesis. Indeed,preliminary information from our laboratory confirms that fen-bendazole inhibits HIF transcriptional activity in cell culture in anadditive manner with other HIF inhibitors (data not shown)."

Only in 2021 did there appear a real-world anti-cancer study of fenben on humans. It only involved 3 subjects though. On the other hand, all three were cured of cancer:

- Feb. 10, 2021, Clinical Oncology Case Reports journal, 'Fenbendazole Enhancing Anti-Tumor Effect: A Case Series': *"Background: ... Although there are no reported cases in the literature, there have been several anecdotal stories published on website blogs with individuals praising its ability to treat a wide variety of cancers.*

  Herein we describe the cases of three patients with various genitourinary malignancies who demonstrated complete response after receiving FBZ therapy as a single or supplementary chemotherapeutic agent. In two patient scenarios, they had experienced progression of metastatic disease despite multiple lines of therapy prior to initiation of FBZ. No side effects from FBZ were reported.

  Conclusion: FBZ appears to be a potentially safe and effective antineoplastic agent that can be repurposed for human use in treating genitourinary malignanc"

Instead of doing a proper follow-up study on the 2008, with additional (natural) vitamins and maybe on humans, a second study by Yale

researchers only caused confusion:

- Feb. 2013, International Institute of Anticancer Research, 'Fenbendazole as a Potential Anticancer Drug' (study by three Yale professors): *"Intensive treatments with fenbendazole were toxic to EMT6 [tumor] cells in vitro [but did not improve cancer death in combination with radiation or chemotherapy drugs, even causing additional toxicity.] Conclusion: These studies provided no evidence that fenbendazole would have value in cancer therapy, but suggested that this general class of compounds merits further investigation."*

43 positive user experiences with Fenbendazole

Most notably and much more interestingly, this author has never seen a longer list of people claiming not only that a drug/supplement worked, but that it actually fully cured their cats, dogs, horses, family members and themselves, in this case of something supposedly impossible: cancer. The fame of the drug really took off after an April 2019 news report on Joe Tippens, who cured his heavily metastasized endstage cancer in three months with Fenbendazole, after a tip from the owner or employee of the local pet store - whose network likely found the 2009 study on mice cited above. Rumor has it that the drug's anti-cancer potential already was known about in the early 2000s. This seems a bit early, but one presumes that certainly post 2008 - due to the above 2008 Journal of the American Association for Laboratory Animal Science study - a few pet store suppliers starting taking notice of Fenben's potent anti-cancer properties.

1. **April 26, 2019, YouTube upload by ABC's 'KOCO 5 News', 'Edmond man says cheap drug for dogs cured his cancer' (comments shut off):** *"*
   [JOE TIPPENS:] *My neck, my liver, my pancreas, my bladder, in my bones. [The cancer] was everywhere.*
   [NARRATOR:] *Two years ago Joe Tippens says he was told to go home, call hospice, and say his goodbyes. The doctors were unanymous that he was going to die of small-cell lung cancer.*
   [JOE TIPPENS:] *Once that kind of cancer goes that far afield, the odds of survival are less than 1% and median life expectancy is three months.*
   Tippens says he went from 2020 pounds to 110. But that was January of 2017. Today Tippens is very much alive. ... Tippens says he got a tip. Not from a pharmacist, but a veterinarian. And in his desperation he turned from people medicine to dog medicine, specifically Fenbendazole, or what you give a dog when it has

worms. [Holds up a packet of: "Prosense Dewormer Solutions ... 3 day treatment with three four gram pouches. Each pouch treats 40lbs. For dogs only."]

[JOE TIPPENS:] *Truth is stranger than fiction, you know.*

[NARRATOR:] *Just three months later Tippens says his cancer was gone.*

[STEPHEN PRESCOTT: President, Oklahoma Medical Research Foundation:] *I was skeptical, and maybe still am, about this one. But there is an interesting background to this. ...*

[NARRATOR:] *He says Tippens is not the first person to potentially benefit [from Fenbendazole], and maybe not the last.*

[PRESCOTT:] *Scientists at many credible places have done work on this for years. ...*

[NARRATOR:] *Prescott says he is now working with Tippens to organize a case study. ... Tippens took the medicine with daily vitamin E supplement and CBD oil. He was also taking an experimental cancer-fighting drug, but Tippens says out of the 1,100 patients on that clinical trial he was the only one cleared of cancer. Tippens says he was saved by the dog dewormer. ...*

[JOE TIPPENS:] *My insurance company spent 4.2 million dollars on me with traditional means, before I switched to a 5-dollar-a-week medicine that actually saved me. ... I've got now over 40 success stories other than me. ... I'm tired of answering that . If I have saved one other person than me, it's worth it.*

[Studio host:] *Interesting thing though, he mentioned $5 for that. He said it has actually doubled in price. Because when you type in Fenbendazole in Google, one of the first or second things that pops up is "cancer cure"."*

2. **YouTube comment:** *"I have to add....a friend of mine has had cancer multiple times. He was in the last stage and his wife found a Website where a cancer researcher testing mice with cancer was treating them with fenbendazole. (Animal dewormer) In the interim, she caught cancer and was in the last stage. She started to take the dewormer and in 8 weeks her scans were clear! My friend took the same dewormer and he too was clear in 8 weeks. He continues to take it weekly at certain doses and has been clear for 2 years!! ... [Reply:] My friend takes 1oz [30 ml] a day for 3 days then off 4 days. He does this every week. In 2 years he is cancer free. He takes it in his oatmeal. No side effects."* **Reply 1:** *"This is true!!! I saw a guy on an episode of 20/20 that did the same for himself!!!"* **Reply 2:** *"I likewise, have been taking Fenbendazole for just about 3½ months now, upon hearing about the guy who made this known world-wide, Joe Tippens. The guy was interviewed on a TV station and that 4-minute piece is here on Youtube, titled "Edmond man says cheap drug for dogs cured his cancer."*

3. **YouTube comment (1 month old when I found it):** *"I started using Fenbenzadole 222mg daily for my stage 3 rectal cancer. After only 14 days, my tumor shrunk from 26.0 to 8.14, it's a miracle unconventional method. Do you want to live or die. ... I'm doing much better and hope soon my tumor will totally vanished. I'm glad I ran across Joe Tippens YouTube video, it sold me."*
4. **YouTube comment:** *"Thanks to Dr Jones, my cat is alive after being diagnosed with lymphoma. The 'licensed' Vets wanted to start radiation and chemo right away; I said no and my research led me to Fenbendazole thanks to Dr Jones' videos. Today, 6 months later, my cat has increased her body weight by 50%, and ultrasounds finds no detectable masses in her intestine or kidney."*
5. **YouTube comment:** *"My dog was diagnosed with large tumor on liver given 2 weeks to live. This was 1/26/2024 been using panacur and I am ready to schedule a full groom for him. Just saying."*
6. **YouTube comment:** *"**Update** Both of my PET and MRI scans reveal that there is no evidence of metastatic disease present in my body! In four months, the eight lesions on my liver ranging in size from 4mm to 10mm are not present on my scans. The MRI states that the intense metabolic activity in my liver has resolved....praise Jesus!!! I started taking one gram of fenben along with chemo back in January. There is no doubt in my mind that the fenben [Fenbendazole] did the majority of the work."*
7. **YouTube comment:** *"I have a friend with cancer who is taking Fenbendezole and iver Mectin. His tumors are shrinking and he feels great. My other friend is taking fenben for a prostate issue and it I has cleared up. An old friends mom just got diagnosed with cancer and just stated on the fenben, is improving, tumors shrinking and she is feeling better in just a month..."*
8. **YouTube comment:** *"I'm an "unlicensed" throat and lung cancer survivor who has studied fenben for four+ years. I have been on it for, as of this date, 19 months and I'm cancer free. I've lost relatives and friends to cancer and have tried to get them to at least look at this. Because they believe so strongly in traditional methods they refuse and they have since died."*
9. **YouTube comment:** *"This woman is misinformed and that's the nicest thing I can say about her. I have a cat who was diagnosed with stage IV pancreatic cancer in December 2021 and was given three weeks to live. Thank God your video showed up in my YouTube feed. Simba went on fenbendazole the day after diagnosis and, I am happy to report he is living his best life since then. He's sitting next to me as we watch this video"*
10. **YouTube comment:** *"Rock on man. My stepdad just got diagnosed with colon cancer and a tumor outside the colon wall. We have a friend who's mom was dxd with colon cancer that had spread to her*

lungs. She's doing fenben and every checkup has shown a decrease in the tumor size."

11. **YouTube comment:** *"I followed your advice, and my dog, who has breast cancer, has 2 breasts removed and given a couple of weeks to live, is still going strong 1yr later. She looks great and plays like a puppy, gaining weight and loving life."*
12. **YouTube comment:** *"I treated my breast cancer holistically under the care of a holistic doctor, and a dewormer [Fenbendazole] was part of the protocol. I'm in year five cancer free!"*
13. **YouTube comment:** *"I'm taking it also for breast cancer. I didn't use chemo or radiation, The radiologist argued that the mass on my hip was cancer after using Fenbendazole, The mass is gone! ... you get the powder packet kind 1 gram [note: only 22.2% / 222mg of active Fenbendazole], three come in a pack. And you use one a day for three days, four days off the next week you'll do the same thing like pick Sunday Monday and Tuesday to use the fenbendazole and then off on Wednesday Thursday and Friday and Saturday. Some people with real aggressive late stage cancer have been using it every single day. You can also buy the liquid in you 2.2 mL every day you can even use it twice a day if you're a cancer is very aggressive."*
14. **YouTube comment:** *"My mother's friend was told by her oncologist to take fenbendazole 20 years ago [around 2003]. Let that sink in, 20 years. She had stage 4 cancer but was also in the operating room almost immediately after finding out (which I find a bit inconsistent with stage 4, but nonetheless). She's still alive today. Never heard her credit the fenbendazole to be clear, but I was more interested in the fact this was on the radars of some oncologists decades ago."*
15. **YouTube comment:** *"Fourteen months ago I adopted a 32 year old white horse, with multiple melanomas under her tail head and vets said she had them throughout her body causing her to colic. Euthanasia was suggested due to age and prognosis. I put her on a daily dewormer, only to help with her gut issues, yet noticed about 8 months into her care, the melanomas have decreased in both size and numbers. She is running around the pasture with her herd mates and healthy. This was not expected, nor even considered, but what a wonderful side effect!"*
16. **YouTube comment:** *"Thanks for the great video. My partner was diagnosed with bladder cancer and was basically told to have his bladder removed and live with a bag the rest of his life...oh yea...and take chemo and radiation as well. He declined and his doc told him he would probably be dead within the year...where do they learn this kind of patient care? He began Tippens protocol with panacur, cbd, quercetin and turmeric. That was 5 years ago and at 80 years young he's still going strong, walking 2-3 miles each day and eating a vegan diet. He certainly had nothing to loose by trying the Tippens*

protocol, but has gained a full life instead of the dire prognosis he was given by an uncaring medical doc."

17. **YouTube comment:** *"I was diagnosed with Stage 3 colorectal cancer in February of this year. I started taking fenbendazole along with my chemo treatment and, as of early July, I am 100% cancer free! Was told that it was a less-than 5% case that chemo alone yields a full response. When examining the area my tumor was previously present, they found no visual evidence that it was ever there (0 visually-evident scarring)."*
18. **YouTube comment:** *"I started panacur about 2 years ago. I had lung cancer that was only spreading. I started immunotherapy at the same time. My first ctscan was three months later , the tumors were gone. I truly think it made the difference. I had nothing to lose by trying it. off immunotherapy 6 months now, still clear of cancer. continuing panacur."*
19. **YouTube comment:** *"Our shepherd was diagnosed with osteosarcoma and given three months to live. We found the Joe Tippens story and followed his protocol. It worked and he was cancer free and lived for more than three years and died because of old-age degeneration (hip dysplasia and arthritis rendered him unable to get up or walk) at 13 years old."*
20. **YouTube comment:** *"When my little dog was cured of cancer using Panacur, I became a believer."*
21. **YouTube comment:** *"Fenbenddazole completely got rid of my dogs Lymphoma. That was all I gave her and she was at a 2700 cell count for cancer, after 6 months it started to go back to normal. She was cancer free with in a year!! Good Luck!!"*
22. **YouTube comment:** *"Thank you Dr, my dog is cancer free thanks to your first video about panacur, Liver cancer gone & that was a year ago. Confirmed by three different vet's. God Bless."*
    started to go back to normal. She was cancer free with in a year!! Good Luck!!"
23. **YouTube comment:** *"i live in arizona and had skin cancer on my arms...since drs are not at the top of my list, i decided to try fenbendazole...3 days on and 4 days off...first week, i noticed a decrease in size and reduced itching...2nd week, it continued to shrink...by week 3, the cancer was skin level...week 4, all that was left was a slight discoloration of the skin...since i wasnt sure how deep it went, 2 more weeks were added...its been 6 mths and you cant even tell there had been skin cancer...i now keep a bottle in the fridge at all times just in case...way safer and way less expensive than going under the knife..."*
24. **YouTube comment:** *"My brother had an esophageal tumor. I sent him the Tippins protocol video interview. He started on the protocol. His tumor shrank so much that the stent the doctors had put in his*

esophagus to keep it open for eating, drinking and breathing, fell into his stomach. There was only a scar tissue thing left where the tumor had been. I'm not sure (he lived in Montana) if he kept up the program or not, or if the cancer had metastasized. Communication with my brother was difficult for a variety of reasons. He did end up dying, but I don't know if it was from the cancer or something else. All I know is that both he and I were blown away by the tumor practically vanishing, and quickly, too. I know it doesn't work on everyone, but it worked on him for that tumor."

25. **YouTube comment:** *"I too heard about panacur and used that with melatonin for my pit bull with cancer. it's been a year and 1/2 and she is cancer free. her protocol was supposed to b surgical removal and chemo. she had neither..."*
26. **YouTube comment:** *"I'm a 245LB male, have nose/throat and kidney cancer that spread to my brain. Was suppose to die within days to weeks, from the cancer spreading to the Brain. In my desperation, I ingested an entire Panacure C Packet which was 888mg of a 4 gram total. I did get heart palpitations and heart fluttering, cold sweats, and constant diaheria for about 8 hours, so it was important to stay up on hydration and water to keep the anxiety level down. But I will say this, that 1 day was a complete 95% 180degree turn around from death. I've been feeling better day to day on lower doses of 444mg of a 2 gram packet. My body can manage 444mg better because of my body weight. For me though I focus more on my thyroid, not so much vitamin C, but I do take 600mL of vitamin D, 1mL of pure nacent iodine, along with 900mg of turmeric with black pepper, and CBD oil, along with a midsized apricot kernel to get the Latril that will convert to hydrogen cyanide. Keeping down inflamation is critical. Also because I am a juvenile diabetic, I have to stay away from carbohydrates after 1pm or it just becomes glucose uptake for the cancer cells when I am sleeping. Any one can beat cancer. They just need to know how their body functions, and how much toxin they are willing to take initially to cause enough shock to the tumors and masses."*
27. **YouTube comment:** *"Used Fenben for colon cancer. Now cancer free no chemo no surgery. Took 222mg twice daily."* **Reply:** *"Please switch from nacsent to lugols iodine. Much more effective."*
28. **YouTube comment:** *"I'm rotating fenbendazole, menbendazole, and ivermectin. Side effects are; a little nap, a big poop, and eliminating cancer. I'm very grateful to Joe Tippens. I have also quit alcohol, Quit sugar, quit toothpaste. I'm grateful to my surgeon. 3 years no doctors no chemo no checkups."*
29. **YouTube comment:** *"My wife has had her breast cancer return in her spine after 13 years (could had been triggered from the COVID19 vaccinations), and in addition to the cancer drug (which will not remove the cancer but stop its growth), she is taking Fenbendazole*

(500mg) in capsule form, 1 caps twice a day along with Vit C & E, and hemp oil capsule. She has had no reactions to Fenbendazole. Her cancer blood markers came down from above 200 to 44, normal is 42. So, she is experimenting with Fenbendazole and she will see what occurs when she has follow-up scans etc probably in 12 months time. If the cancer is totally gone, it will be from Fenbendazole, and not from the cancer drug. Fenbendazole has not affected all her blood tests." **YouTube comment:** *"It works. but i would up her dose...i started on 30mls of liquid fenben i mix with juice. One week in and my breast is shrinking, the pain is gone...i do take other supplements, but its the fenben...."*

30. **YouTube comment:** *"I had stage 3 colon cancer had tumor removed and 28 lympnods after further study on my own. Refused chemo. Took dog [de]wormer and CBD paste cancer is gone."*
31. **YouTube comment:** *"I treated myself with Fenbendazol (parasite med) for a breast tumor and it was dissolved. That was about the time I saw this vid. No tumor and feel great, better than before when I thought I was checking out. We also used FenBen on my dads cat, who was given a death sentence of feline aides/leukemia. She's cured, showed signs of progress within days of being treated."*
32. **YouTube comment:** *"I was given 3 month "Best used date"! I started the Fenben after seeing this info on a vets tube channel. It went from my pancreas and onto a joy ride everywhere else. I went carnivore and regular fasting with fenben. That was a year ago and I feel great now and all my tumors shrank by 90%. Thanks."*
33. **YouTube comment:** *"Diagnosed with esophageal cancer in April of 2022. Radiation, chemo and an esophagectomy to remove the tumor and half of my stomach. All clear until November of 2023 when scans showed that the cancer metastasized to my liver. I had eight lesions ranging in size from 4mm to 10mm. Started Folfox chemo Jan. 18, 2024 along with one gram of Fenben. No other protocols other than Vitamin C and D3/K2. My recent PET and MRI scans from 4/18/24 revealed that there is no evidence of metastatic disease and that the focus of intense metabolic activity in my liver has resolved. The MRI said that previous noted lesions from scan on 12/26/23 are not visible on this exam.... Praise Jesus!!! There's no doubt in my mind that the Fenben did most of the work!! I have 5 chemo treatments left but I am telling the doctor that I am DONE!!"*
34. **YouTube comment:** *"Joe Tippens saved My Life... Bladder cancer. Bladder was going to be removed. The tumor was into the wall of my bladder they always remove them... still have my bladder. Thank you Joe."*
35. **YouTube comment:** *"My nephew was completely healed of stage 4 pancreatic cancer in just 3 months with taking FenBen 444 3 times a*

week. He had multiple large tumors in his liver and on the mouth of the pancreas. All gone."

36. **YouTube comment:** *"I first heard about the Joe Tippins protocol when I was diagnosed with stage 4 colon cancer in 2020 [so 3+ years ago]. I gave up chemo after one cycle and took Fenbendazole instead. I have now been in remission for 2.5 years. I'm also on keto diet. ... [4 months later:] I took 222mg daily for 3 days a week. I also follow a ketogenic diet."*
37. **YouTube comment:** *"I've been using fenbendazol along with other natural alternatives for almost 3 months. The 2 1/2 inch tumor on my lung has shrunk by 90%! Thank you, Joe Tippens. The oncologists write us lung cancer patients as dead. ... I promised an update. I went for scans today and the oncologist couldn't find any new cancer! All he could find was a nodule on my lung that has changed shape but not in size! I'm thankful to God for my healing! And I'm thankful to God that I found the correct information from Joe Tippens on how to battle an incurable cancer! It's evidently curable with iver and fenbendazol tho!"*
38. **YouTube comment:** *"Thank you For the podcast. I started the uncle Joey protocol in October 13th. On October 10th, I had my tumor markers bloodwork, they were very high, on November 7th, the tumor markers had dropped more than 50%!!! I have great positive feelings that this is going to be the best results."*
39. **YouTube comment:** *"I had radiotherapy for cancer in my throat on the tonsil, yes that cancer was cured but radiation causes thyroid cancer, and when mine started blowing up a couple months after treatment I took fenbendazole and the swelling went down and hardness too - in the voice box using layman's words. My hoarse voice that came on suddenly a couple of months after the treatment had ended was also fixed by fenbendazole. Fenbendazole is very like the white milk in dandelion stalks, in fact I met a lady recently that cured her cat cancer with dandelion which also cures cancer."*
40. **Website comment section comment:** *"I have used FBZ after the other remedies only cleared up some cancers in the body. And then the FBZ cleared the rest. But also I have seen people go to NED only using straight FBZ and nothing else. Not even vitamins. I've also seen FBZ not work. But this is not as common. Because I combine FBZ with other treatment modalities. And then some people won't consider anti parasitics even when witnessing their friends having cleared C[ancer] with it. I have a family member that won't do it as well after seeing me do this since 2009. Human psychology is a trip."*
41. **Website comment section comment:** *"As a care giver thanks to Fenbendazole I was able to bring back a stage 3 Multiple Myeloma patient who correctly rejected a toxic chemo therapy/useless stem cell approach (harvesting his own stem cells) who was given a grim prognosis of 2 months to live to100 percent full remission in seven*

months. However, it called for much more than just Fenbendazole. I had to make sure that his glucose intake was eliminated ie - he enjoyed a few bottles of wine ever day that i convinecd him needed to be eliminated and substituted this with canaboid oil that also has some anticancer properties and had a way of relieving his anxiety. Substituting sugar with allulose was crucial. supplementing vitamins etc and the list goes on."

42. **YouTube comment:** *"Told a 49 year old female with stage 4 lung cancer..she takes it daily..cancer free after one year..her oncologist wants to write her up in a medical journal..I told her big pharma wouldn't allow that!"*

3 semi-positive user experiences with Fenbendazole

Fenbendazole doesn't always kill the cancer. At least sometimes it just stops it in its track, even at average or higher doses:

1. **YouTube comment:** *"I've been treating my American Bulldog with fenbendazole for cancer. She was given 2 months to live by the Vet oncologist almost 4 years ago. She's been terminal with metastatic aggressive anal gland cancer but she doesn't know it. She gets full deworming dose of Panacur C 3 days on 4 days off. No side effects and perfectly healthy, except the tumor is still there. I don't bother with any tests or scans, just monitor the tumor and giver her Panacur and a bunch of anti cancer food and supplements. I also fast her 36-48 hours once a week. She does't like fasting but it shrinks the tumor more than anything. The Vet oncologist measures her tumor and tests her blood every few months. He doesn't treat her cancer but prescribes Gabapentin for her arthritis because she's 13.5 years old. He's so fascinated the she's still alive and doing well because dogs don't live with this type of cancer even with the best treatment more than 2 years. We tried a couple of chemo drugs but they didn't work. Fenbendazole works. Joe Tippins has the human dosage."*
2. **YouTube comment:** *"I was diagnosed with early stage prostate cancer. My psa level was 4.0 which is in the red flag area. I started talking fenbendazole and within 5 weeks my psa level dropped to 2.6. I really don't care what the medical community thinks or says. This particular drug is killing my cancer. ... My dosage is 1 gram of the powder (panacur c) to one bottle of water three consecutive days a week. Then off 4 every week. [After someone suggested 2000mg minimum and to take it with fat:] Who cares if it doesn't*

dissolve in water, 2nd, I was asked how I take it... I take it in the morning three days a week with food. ... ***[A few months later:]*** *Just a quick update folks. I went in for another blood test 11-1-21 and my psa dropped another. .4 so now I'm down from 4.0 last year at this time to 2.2. This stuff is no joke it's a cancer killer. ... I don't have any side effects at all [from taking fenbendazole]. ...* ***[The next February:]*** *I went for a blood test 2/18/22 and my psa is still at 2.6. I thought it would be lower but I'm happy it's staying in the good range. ...* ***[1 year later:]*** *It was exactly the same size as it was from the start. So I can say that the fenbendazole has stopped it in its tracks."* **Reply:** *"TAKE VERY HVY. DOSES. HAD PSA OF 600. HAS BEEN UNDETECTABLE FOR 14 MONThS. 0 SIDE EFFECTS."*

3. **YouTube comment:** *"My aunt was diagnosed a month ago with the same cancer that Joe had, exactly. She has now been on Fenben for almost 2 weeks, and we are thanking God for leading us to this protocol. ...* ***[Update 3 months later:]*** *Unfortunately, my aunt had another complication. She developed small lesions on her brain, which the doctors did not believe were due to the cancer, but possibly from the chemo, they couldn't be sure. The lesions caused inflammation and swelling in her brain, and she passed away from that. The tumors appeared to remain the same without advancing. For me personally, I would opt out of chemo. I would add MMS [Miracle Mineral Supplement] and DMSO [Dimethylsulfoxide] to the Fenben protocol."*

7 failed user experiences with Fenbendazole

Failure stories are surprisingly hard to find, although the earlier cited South Korean study indicated that only 79.1% of persons taking Fenbendazole reported positive effects. "Positive effects" doesn't mean "cured", and it appears that for at least 20.9% Fenbendazole did nothing. Now, it must be said that many optimistic cancer-suffering YouTube users starting their Fenbendazole self-treatment, do not give additional updates, even when asked to do so by other users. I've yet to see an account of such a person that contains any signs of life a few years beyond when they reported starting their self-treatment. Who knows? Maybe they lost their login, as I have so often. But you have to assume the worst. As I look deeper, I do find more and more people for whom fenbendazole did not save them. In some case, the fenben worked, but only temporarily. Even doing keto, fasting and fenben together is not a guaranty. I've yet to find a person combining a purely anti-cancer greens diet with fenben, but it's clear fenben is a not a cure all. But even in cases where it doesn't work, it does seem to very often improve the quality of life and buy extra time.

1. **YouTube comment (a bit of a success story, but claims fenben didn't cure it):** *"Dude, I just got out of surgery for my tongue tumor. Which the plan was, before I shrunk my cancer tumor, was to take out all my teeth and to cut out 2/3 my tongue. I did dog dewormer [fenbendazole] amongst everything your doing, which I'm sure helped. I got to physically see my cancer every day. I really witnessed a stop of growth and a coming back of tongue tissue when I started MMS, chlorine dioxide, (water purifier). Taste like pool water, I did not die, but the cancer was dieing.*
   So they left my teeth and only took out less than half my tongue, along with 70 lymph nodes which the doc said PET scan did not look good and would be over 50% cancerous along with my salivary gland. They came back no cancer 0/70.
   I was battling this for a year, with nothing stopping the cancer growth accept for MMS [Miracle Mineral Supplement - chlorine dioxide]. If I did not have surgery I feel this would have completely abolished the cancer. Now looking forward with my recovery in hindsight, I feel I would have healed without surgery. I went from stage 4 tongue cancer to only localized tongue cancer. I will not leave home without MMS, also convinced my family members to take it (they also witnessed the miracle). The cause of my cancer parasites, mouth parasites called Pirokeets, environmental stress, mental stress, and a toxic body. YOU NEED MMS."
2. **YouTube comment (person already on death's door, but apparently lived for quite some time still):** *"Just sent my dad home on hospice so i just started giving him the fendbendazole and between it and God its our last hope. ... **[Update:]** Ahh thank you for asking [for an update]. He was getting weak, cause he looses blood on the inside somewhere, like his blood count was 5.7 and he didnt wanna go to a hospital anymore. And I said pops please, and i kinda argued with the hospice nurses, cause it seems to me that they wanna let him die without saying so. ... **[Update 2 months later:]** Well it still seems up an down. We havent had no looks inside him to see if there is any shrinkage. ... I give him 3mg [likely 3000mg / 3g] every day for 21 days and take 3 days of. **[Update another few weeks/months later:]** He passed this morning 8/23/20 at 228 am."*
3. **YouTube comment (on death's door, still apparently a halting of further growth):** *"My girlfriend was diagnosed with brain cancer 5 weeks ago and the prognosis was bad. I asked god for help and then i came across the joe protocol. 4 weeks in and after seeing this podcast im filled with hope. **[Update 3 months later:]** From getting her prognosis to dying took three months. If only we had caught it earlier. Whilst on the fenbendazole her tumors stopped growing so i saw in real time it was working. The sad part was she had so many complications and eventually became unconscious so couldn't*

carry on taking her medicine. I would tell anyone who gets a cancer diagnosis to take fenbedazole straight away."

4. **survivingpancreaticcancer2510 YouTube account (her last post was on Aug. 28, 2020, after reporting a "huge increase" in turmors, so she likely died):** *"Description [video]: My journey surviving pancreatic cancer using Joe Tippens protocol, fenbendazole, prayers, and a very positive attitude.*
   - Diagnosed in October of 2018 - Stage 1 Adenocarcinoma (tumor at the head of my pancreas).
   - Folfirinox Protocol - Nov 2018 to Jan 2019.
   - Gemcitabine w Radiation 3 weeks straight.
   - No Treatment in March in preparation for surgery.
   - Whipple Surgery April 2, 2019.
   - June of 2019 - 20-25 Metastases to my liver. Began Gemcitabine and Abraxane Chemo. 2 weeks later began Joe Tippens Protocol. 3 months later 16 of 25 tumors were dead.
   - Stopped chemo to check efficacy of JUST fenbendazole. [Note: understandable, but maybe not advisable]
   - December 2019 - increase in tumor markers (two tumors growing back).
   - Began Gemcitabine in Jan 2020. tumor markers still increased.
   - Added in Abraxane In Feb 2020.
   - Tumor markers slowly still increasing - current March 2020.
   - 2508 [Aug. 25?] current CA-19-9 (still on fenbendazole as well).
   - [Last post: Aug. 28, 2020]."
5. **May 25, 2024 YouTube upload by 'Tony's Everyday Life', 'Fenbendazole is not working! Now what? Stage 3 Rectal cancer' (his protocol is very extensive: already does 6 months of keto, over 1 month carnivore (his ketosis meter shows he's not in ketosis half the time despite only eating meat); 1x multivitamin, 1x coral calcium, 1x vitamin E, 1x berberine, 3x clear lungs (peppers), 3x 1,000mg turmeric, omega 3, fenbendazole 222mg (Sinair: had them tested), 1x CBD (knocks him out to sleep), CBG RSO 1-3x a day, 1x Indica vape, 1x sweetpeas CBD 2500mg bottle; injects CBD right onto the tumor in his asshole; always notices less bleeding after):** *"Back January to March this tumor actually grew ... about 12.5%. ... March to May it grew 30% more. ... That is not exactly what I was hoping ... fenbendazole would do."* **Feb 22, 2024 YouTube upload by 'Tony's Everyday Life', 'Is Fenbendazole and CBG saving my butt? Results of CEA tumor marker revealed':** *"Ever since I started the fenbendazole, the bowel movements for the rectal cancer have gotten better, seeing a little less blood. ... The frequencies to the bathroom are starting to diminish. At first when I started to take the fenbendazole, I did start to gain weight again. Recently I have lost some weight [but] I have completely cut out sugar and carbs. I'm down to 1 gram of sugar. The reason I say that is because you just can't avoid it. ...*

And the carbohydrates, I'm probably down to 5 to 6. ... Starting to watch the net carbs. I've upped my fenbendazol. I'm up to 3 capsules a day. ... I feel like I'm getting my strength. ... The neuropathy in my feet really has just diminished my strength."

6. **Reddit comment:** *"I collapsed with something similar—central brain glioma, only otherwise ever confirmed in babies—in 2011, when I was 23. Still here, over a decade later, having had a noteworthy career. ... I declined chemo and radiation. I'm too rare for applicable trials to exist. I tried keto and starvation before my second craniotomy, and I've continued with keto. My medical team isn't sure whether it helped, but it didn't hurt. Tried fenbendazole: no difference. Now on Lamictal to block glutamate, and still seeing slow growth."*
7. YouTube upload by 'Tumor Tales - Scot Pekarek': Born 1973, loved long-distance running and cycling, diagnozed with grade 2 glioma (brain cancer) on Aug. 17, 2019. Died on Jan. 6, 2022 at age 48, one assume from the cancer. In his last Nov. 26, 2021 he was looking pretty good, relaxed, spoke out against Covid lockdowns (earlier also called it the "plandemic"), and didn't mention any health issues. He seems to have a had pretty good quality of life in the 2.5 years that he lived and was taking daily fenbendazole (up to 4 grams a day, although not sure if this is the powder or purely active ingedrient), except probably from the last few weeks. He had an MRI update after the first few months, while doing keto and fenben, at which point the cancer hadn't grown. It appears he didn't post any more MRI updates after that anymore, and didn't seem to know anything about progress - which probably means he didn't do them anymore:
    - **Aug. 17, 2019, 'Morning before the Tumor was Found 8/17/2019':** Just did a 5 mile run. Explains he has a spiritual existential crisis. Looking for meaning in life. He has an old skin for his age. Explains he drank to much recently, and was ashamed of it. Apparently he went to the hospital in an ambulance that day.
    - **Sep. 30, 2019, 'Day 0 Introduction to Scot Pekarek and his Brain Tumor battle':** In a video on the same day he says: *"I have a grade two glioma - brain cancer. I have documented this journey, this fight, where I am gonna kick its ass, and I'm gonna do it through non-conventional treatment. ... I'm gonna share all of this with you - bring you all along on this journey, where I am going to win this battle against cancer using methods that most of you have probably never heard of."*
    - **Sep. 30, 2019, 'CANCER KILLER: Trying out Pancur C / Fenbendazole, ie. Canine dewormer 9/24':** Refers to Joe Tippens. Grade 2 Glioma. Has been starting his keto as well.

- **Oct. 1, 2019:** various forms of turmeric/curcuminm, liposomal vitamin C, magnesium citrate, baking soda (keep body more "alkaline"), milk thistle, true cinnamon, St. John's wort, Black Seed extract, fenbendazole, ginger root, etc. He has been eating 4 garlic cloves a day.
- **Oct 9, 2019, Scot Making Some Snake Juice! Thanks to Cole Robinson Snake Diet!:** *"Keep my body in a ketogenic state, and also starve the cancer of glucose, glutamine, all the things that cancer loves. So I do what is called snake juice, Cole Robinson's snake diet, and basically this electrolites, salt, and stuff to keep my body from cramping up while I'm doing a 24, 48, or 72 hour fast. My first fast I did go 8 days. It was epic. I did not realize I could do something like that. ... I've done dry fasting and stuff. ... This is some Himalayan [pink] rock salt. ... Then you put in potassium chloride. I usually put in half a tea spoon to a full tea spoon... Then I put in apple cider vinegar, organic... about 4 table spoons. ... lemon juice ... cayenne pepper... Cancer likes an acidic environment, so the idea here is adding a little baking soda."*
- **Dec. 15, 2019:** Second video with fenbendazole in title ('Healing from Cancer: foods-supplements I'm eating (fenbendazole included!)'). Shows it alongside two dozen supplements he has bought and researched in the previous 4 months. Among the supplements he shows are sodium bicarbonate (to try and keep his body "more alkaline"), Hawaiian spiritulina, astragalus, ashwagandha, ginseng, basic turmeric with black pepper extract, OHEA-M, St. John's wort, sambucus elderberry, echinacea, graviola, vitamin D, zinc, liposomal vitamin C, Ceylon cinnamon, paw paw, boswellia, supermarket mushrooms, baby spinach, brussels sprouts, broccoli sprouts, kale, cilantro, celery, and avocado; fresh ginger, fresh garlic, garlic powder, Core Warrior Greens, milk thistle, coconut oil, baking soda, CBD, monkfruit extract: *"Berries. If you are going to have fruits, watch the fruits. Lots of sugar. Cancer likes sugar. ... I've been told to stay away from potatoes. ... If you put fenbendazole on any videos, it gets way more views. I know whyyy. Same reason I am taking it. ... I take it food now all the time."*Has also been using Chaga mushrooms.
- **Dec. 18, 2019, 'Brain Cancer News from the battlefront! Mayo Clinic':** *"The good news is, there has been no growth in the tumor. That's good. We have stopped the progression in the course of 4 months. The other news is that it hasn't noticibly shrunk either."*
- **June 15, 2020, 'Fenbendazole Brain Cancer update and next MRI schedule':** *"I'm doing about 4 grams of fenbendazole, 4 times a week. I'm doing the vitamin E, curcumin, garlic cloves, 2 closes,*

twice a day; ... Ginger ... in a smoothie... blackberries... Triple fairy mix. ... The black pepper with the curcumin. Turmeric, basically. That's pretty much it. Vitamin D. Vitamin C.... moringa... ashwagandha ... Some CBD oil..." Comment by a "Kabib": *"I was diagnosed with Parkinson's and was so worried about the potential for cancer I was using a lot of the same supplements as you for prevention I was shocked to get my bad news. The only thing I keep telling people is at least it's not cancer. I'm not sure which is worse other than the fact you have a greater potential to kill ur disease than I do. It's easy to get depressed and I look forward to listening to you for positivity. Good luck on your journey my friend. I'm gonna be in it for the long haul. I'll be following your success story !!!"*

- **Nov. 16, 2021, 'Fenbendazole and Eggs! Yum':** *"I have yet to get sick. And I've gone to work basically every day. ... This is a 1 gram packet. Sometimes I do 2 or even 4 gram packets. ... And yeah, I think this stuff is working. ... If I'm dead in two years, I guess it didn't work."*

Fenbendazole dosing, manufacturer, misinfo/disinfo and more

Doses

- People claim it almost has no side effects, but this author got painful stings from it two-three weeks in of a trial of 250mg a day. After stopping Fenbendazole, the issues disappeared.
- Joe Tippens used a dose of 222 mg a day, 7 days a week (3/4 days he considers a potential "maintenance dose", which he did not take and does not prefer), of Fenbendazole (1 gram Panacur-C, with 22.2% active FenBen ingredient), or about 4.5mg per kilogram (kg) of bodyweight. This is an extremely low dose compared to what you are supposed to give for deworming animals. Apparently he used turmeric/curcumin from the start or early on, at a dose of 100mg per 10lb / 5kg bodyweight (he probably used basic turmeric or a less potent version of curcumin; he later recommended the very potent Theracurmin, followed by the even more potent Ultracurmin), so about 2,000 mg. He certainly used CBD oil, and recommened the THC-free Forgotten Trails CBD oil (forgottentrailscbd.com/products/). You can drop this CBD under the tongue for best absorbtion. 2-3ml daily per 10lb / 5 kg bodyweight. He also initially used a vitamin E supplement, but later removed this from his protocol due to worries of actining as a blood thinner. In later years he also recommended modern blood-available versions berberine and quercetin (in onions, green tea/matcha and rooibos tea), and pills with EGCG (in green tea/matcha).

- mycancerstory.rocks/81-2/ (accessed: May 27, 2024; Joe Tippens' official site; in later years he links to "Onco Pathways" (explained he has no financial connection), which is going to set you back thousands of dollars over 3-4 months. 4 pathways: "Current price is: $422.69".): *"THE PROTOCOL: Update from October 28, 2021:*
  - Fenbendazole 222 mg (1 gm of Panacur™ or Safeguard™) per day every day. Note if you are using liquid - most liquids are 100 mg/ml. You would take 2.2 ml of the liquid.
  - Onco Adjunct™ Pathway 1™ - 2-4ml 2 times a day depending on your weight. ***[CBD oil with Nano MCT oil: $275 separate for 30 ml.]***
  - Onco Adjunct™ Pathway 2™ - 3 capsules 2 times a day only when you are off chemo. ***["Brown Rice Protein-Curcumin-Quercetin Complex ... UltraCur": $54.50 for 180 capsules.]***
  - Onco Adjunct™ Pathway 3™- With each meal - 1 (one) capsule with a light meal and 2 (two) capsules with a heavy meal capsules 2 times a day if you are trying to starve your cancer of sugars. ***["Whey Protein - Berberine Complex (Berberine HCL)": $57 for 120 pills.]***
  - NEW - Onco Adjunct™ Pathway 4™- 2 Capsules twice a day." ***["Fisetin [and] EGCG [and] Resveratrol - Brown Rice Conjugate]": $68 for 120 pills.]***
- mycancerstory.rocks/81-2/ (accessed: Nov. 18, 2022; Joe Tippens' official site): *"IMPORTANT: I will not receive any financial remuneration from this company for the sale of these products and I do not own any stock of the company. I have a significant announcement to make. Several months ago, I was introduced to a researcher who collaborates with other PHD's, MD's and researchers globally in the pharma and nutraceutical space. They have developed some patented technologies that they apply to specific classes of plant extracts and botanicals that dramatically enhance delivery of those ingredients into the bloodstream at exponential levels. Over the months we have met together, and I have performed extensive due diligence on what they can offer. We've discussed a 3-pathway approach and philosophy for cellular support through supplementation that I believe will complement fenbendazole greatly.*
  Pathway 1: *CBD Tincture: CBD has always been part of my protocol, but the new product will incorporate some important changes. As we have learned more about the potential benefits of hemp extracts we have discovered that the species of hemp, the methods of its extraction, the ratios of acidic forms of cannabinoids to non-acidic forms of cannabinoids all play a critical role in how well Hemp extracts can have on cancer outcomes.*

In my research of Hemp extracts – Onco Adjunct Pathway 1 – product hits all of the important qualities for a hemp extract. First the product is cryoextracted, this preserves the terpenes and the non-decarboxylated cannabinoids. Second, this product uses a proprietary strain of cannabinoid that has actually been tested on cancer cell lines. And Third, they supplement the CBGa cannabinoid to standardize it up to 7mg per dose, something that I believe could be significant. Finally, they add in two other important ingredients, the first being Frankincense, an iconic material dating back to the biblical times and recently the topic of a ton of cancer research. The company's work on Frankincense focused on a collaboration with Dr HK Lin, the iconic researcher who studied Frankincense as a supplement for cancer for more than a decade. Together they developed an approach that uses specific fractions of Frankincense that are the most beneficial, according to his research. Finally, a Nano molecule carrier, C60 has evidence to show that it could help significantly with low dose chemotherapy, reducing the rtoxicity of chemo to healthy cells and increasing the toxicity to unhealthy cells.

The Onco Adjunct Pathway 1 is a unique combination of Cryo Extracted Hemp, with Middle Eastern frankincense essential oils and the Nano C60 carrier, all in one tincture. Some people may wish to stay with the previously recommended Forgotten Trails CBD from Pharmacy Plus at mcadoorandy@gmail.com and they will continue to supply that as well.

Pathway 2: Curcumin: Curcumin has always been part of my protocol, but even the product that I have previously recommended, Theracurmin HP, simply does not tackle the problem of absorption into the blood stream. You all know I have recommended Theracurmin for some time as being the best, most highly bioabsorbable Curcumin I had found. What I didn't know about was Ultra Botanica's LPS technology UltraCur (UltraCurcumin). Data shows better absorption above Theracurmin by at least 6X and their consumer experience proves this out. Their product by itself is a game changer in curcumin and I would have left it at that except the science behind Quercetin, an equally important polyphenolic compound as Curcumin also using their LPS technology to make it absorb into the body. Previously I had been reluctant to recommend Quercetin (also recommended by Jane McClelland and many others) as it had the same problem as Frankincense and Curcumin in absorption into the blood stream. Why take something that simply isn't being utilized in the bloodstream? UB's LPS technology solves that problem and they have added

the convenience of taking them together with one product.
Specifically, Onco Adjunct Pathway 2 is a combination of 300 mg of Clinical Grade UltraCurcumin, 200 mg of Clinical grade UltraQuercetin and 100 mg of Frankincense powder. There is a lot I could share about the cellular pathways that Curcumin, Quercetin and Frankincense affect, I will leave that to another time. ***Pathway 3:*** *Berberine: None of you have heard me recommend Berberine up to this point, even though many researchers have recommended it. Much like Frankincense, Curcumin and Quercetin, Berberine also is not bio-available into the blood stream. Something this company's LPS technology solves. In evaluating the new curcumin and new hemp options I had the opportunity to take a fresh look at Berberine. As most people know, cancer cells are devourers of sugars / glucose in the body. In fact, cancer cells are glucose monsters. Jane McClelland and many cancer coaches strongly recommend starving your cancer cells by ketogenic diets, and Care Oncology recommends Metformin in its protocol for the same reason. For those of you that are serious about starving your cancer cells from glucose, adding in Pathway 3 to your regime could help. Berberine in its soluble LPS form modifies glucose metabolism in much the same way that Metformin modifies glucose metabolism. The scientists in India proved that Fenbendazole is effective in interrupting cancer cells' ability to metabolize sugars and I believe by adding in UltraBerberine as Onco-Adjunct Pathway 3 you further diminish the ability of cancer cells to devour glucose, weakening them and putting their survival at risk.*
You can learn more about ONCO Adjunct and order the products at the following Onco-Adjunct™ Product Page. The reason I am not linking the direct products here, but rather giving you a link to their page is due to FDA regulations. I need to make it clear that the information you'll find on their site is fully compliant with the FDA regulations which prohibit them from saying specifically what the products can do that is cancer specific. Their manufacturing facility is an FDA cGMP facility held to the highest quality standards possible."

- forgottentrailscbd.com/products/ (accessed: May 27, 2024): *"CBD Tincture: 750 mg Broad Spectrum [30 mln bottle]. Our broad-spectrum CBD tincture contains 0.0% THC, while still maintaining therapeutic levels of other naturally occurring cannabinoids, terpenes, and hemp-derived essential oils. Dissolved in a mixture of MCT, grapeseed, and hempseed oil, our unflavored tinctures provide the true "essence" of the hemp plant.*
Suggested use: Administer 1ml oil under the tongue, holding for

90 seconds. Then swallow the oil as an herbal supplement. Or take as directed by a healthcare professional.
Ingredients: MCT, Broad Spectrum CBD Oil, Hempseed Oil, & Grapeseed Oil."

- **Reddit comment:** *"Cimetidine also has noted anti cancer properties but for me it's main purpose is to enhance the bioavailability of the mebendazole I take."*
- Merck's Panacur Fenbendazole 500 has 10 tablets, each with 500mg, with the active ingredient actually being 500mg. The pills are designed to be broken into two when needed, so you can easily take 250mg a day. In contrast, Joe Tippens and others used the Merck Panacur C 1 gram / 1000mg powder packets which contain 22.2% / 222mg of Fenbendazole as active ingredient.
- Traditionally 5mg/kg a day has been seen as the lowest (very) effective Fenbendazole dose against worms in a wide variety of animals, with 1,000x this dose still considered safe. 222mg at 5mg/kg per day would only be suitable for a 44kg / 98 lb individual. However, as an anti-cancer treatment spread out over weeks and months, Fenbendazole seems to be very effective even at around 2mg/kg. The modern-day recommendation for dogs is a whopping 50 mg/kg per day (5 grams per day for a 100kg person, 2.5 grams for a 50kg person), but with this high dose only a 3-day course is generally needed before every last worm is killed. It may not be that simple with cancer.
- merckvetmanual.com/multimedia/table/nonhuman-primate-therapeutics (accessed: May 27, 2024): *"Nonhuman Primate Therapeutics: ... Fenbendazole: 50 mg/kg, PO, once daily for 5 days, repeated in 2 weeks. Ivermectin: 200–300 mcg/kg, SC, IM, or PO, repeated in 14 days. Mebendazole: 22 mg/kg, PO, once daily for 3 days, repeated in 14 days (for Giardia sp)."*

- A small number of people report having side effects to Fenbendazole:

  - **Typical YouTube comment:** *"I've been using 225 mgs for 3 months with no side effects at all. I also don't have cancer (that I'm aware of.) ... I've taken about 3 days off in that time."*
  - James Victory, who tried Fenbendazole in January 2020 without having cancer, didn't notice much his first day, but did have to go to the bathroom twice in the night, with his stool being "darker than usual", almost black", and in the morning he had an unusual appetite. Black stool indicates blood release in the early part of his digestive tract, and the symptoms likely mean that something bad was killed off in his intestines. Some people report feeling bad and symptoms like these in the first days or weeks, and then improve.
  - **YouTube comment:** *"My husband was taking a gram of fenbendazole a day for stomach cancer. Unfortunately he's one of*

the .03% of people who develop anemia [hemoglobin deficiency] from it. We are using Rick Simpson Oil as well, so he has stopped the fenbendazole. He's also using ivermectin and colloidal silver. Make sure you keep track of your numbers. We are bummed that he can't take fenbendazole because he was having good results, tumors shrinking cancer disappearing."

- YouTube comment: *"200lbs male (stage 4 colon, operated, having metastases in liver only).. Tried Fenben three times, 1) 444mg/day dissolved in flaxseed oil.. chased with Curcumin, after 3 days had constipation even with strong abdominal pain leading to extreme nausea but not vomiting.. laxative solved it quickly so that seemed to be a minor effect overall, i was not sure it was related to Fenben at all.. but i took a break from all meds for a few days.. 2) another try: 444mg/day dissolved in flaxseed oil, chased with curcumin, day 3 had the same constipation with nausea + abdominal pain which evolved into a full blown food poisoning situation, with fever, continued abdominal pain for 4 days. treated with laxative, no food for two days, extreme muscle weakness, laid in bed most of the time.. this time my suspicion was firming up, but i thought perhaps 444mg was too much especially since dissolved in Oil it would ingest very well into my body while the "low toxicity" in Fenben spec was based on generally poor absorption into body (!!) because it is totally water non-soluble. 3) several days break again, and tried 222mg/per day prepped same way+chaser, day 2 got moderate abdominal pain+ pretty strong kidney pain, was able to overcome that in about 1 hr with water and a bit of massaging to get blood flowing a bit.. But my conclusion is Fenben is too toxic for me. Went back to Meben 100mg/morning+100mg/evening."*

- Apparently Fenbendazole is removed in a low-profile manner as an off-the-shelf available medicine in some countries:

  - Panacur Fenbendazole is for canine use and freely available. If you you want Fenbendazole for human use, such as Albendazole, you generally need a prescription.
  - July 29, 2022, gov.uk, 'Animal medicine seizure notice: Jubilee Pharmacy trading as Meditech': *"The following veterinary medicines were seized... In July 2019 Fenbendazole, the active ingredient in this product, was removed from the list of approved actives for products manufactured under Schedule 6 of the Veterinary Medicines Regulations (Exemptions for small pet animals)."*
  - YouTube comment: *"Get yer fenbendazole before its off the shelves permanently. Reports that its been removed over in U.K. already..."*
  - YouTube comment: *"Mad because i am in the UK and needed some can't get it at all even in Europe! Wonder what to do only cream form which is no good."*

- **YouTube comment:** *"It's off the store shelves in US as well, had to buy online."*
- **YouTube comment:** *"They have already taken the reviews away from Amazon."*

- Disinformation always is very worrying. You mainly have a number of "conservative CIA" people running around claiming that the Joe Tippens Protocol dose of 222mg/day is much too low. This author noticed this too, but the fact is that you are not doing a 3-day full-colon deworming. You are allowing the Fenben to be taken up in the blood stream and fight cancer throughout the body. The more you take, especially when you take it for months or years on end, the higher the risk of side effects, such as liver toxicity.

- **Twitter post by @ssg_q with an image that reads 'Celebrate MAGA Pride Month' (at contrabandcures.com/ Joe_Tippens_Protocol/, the no. 1 site in Yahoo, but removed in Google):** *"You're first time you took 222mg of febendazole which is a microdose. SO while your cancer went away, you may not have eliminated the root cause. I'd consider 30-50mg/kg this time and alternating with Ivermectin every 2 weeks essentially. Doxycycline or Mesosilver also be beneficial along with high dose C, D, and Zinc."*
- **Twitter post by @SkyEcho with an image that reads 'Celebrate MAGA Pride Month' (at contrabandcures.com/ Joe_Tippens_Protocol/, the no. 1 site in Yahoo, but removed in Google):** *"Is Joe Tippens [controlled opposition], under-dosing us on purpose. That would be VERY effective, because it would lead to: - massive failure. Many people dying of their cancers. - Totally dispelling the "conspiracy theory" of fenbendazole being a cancer cure. - Breeding parasites that are resistant to the meds. Ask yourself why he's so big in China, or why he isn't sensored [sic]... Fenben works, but the doses need to be right, and weight-based."*
- contrabandcures.com/ Joe_Tippens_Protocol/ (accessed: May 27, 2024): *"Additionally, the proper fenbendazole dosing for primates, (which a human would take), can be seen here: MERCK Veterinary Manual. To put this into perspective; the proper dosing for a 150 lb person is 3409mg. Joe recommends a dose of 222mg, which is 15 times less than the proper dose. Watch Mr. Tippens being interviewed here: BitChute: Channel restricted... Contains Holocaust Denial. Contains Incitement to Hatred."*
- May-Aug. 2021, Case Reports in Oncology, 'Drug-Induced Liver Injury in a Patient with Nonsmall Cell Lung Cancer after the Self-Administration of Fenbendazole Based on Social Media Information' (this article, tied to big pharma, is a total and complete hitpiece, more obsessed with social media than anything else; the patient was 80yo, used 4.5x the Joe Tippens fenben dose, possibly involving

some fake Chinese knock off brand; and the liver markers might well have indicated that something was happening, considering the tumor did not progress; in any case, a lone case like this is fear mongering): *"An 80-year-old female patient with advanced nonsmall cell lung cancer (NSCLC) was started on pembrolizumab monotherapy. The patient experienced severe liver injury 9 months later. An interview with her and her family revealed that she had been taking fenbendazole for a month, solely based on social media reports suggesting its effectiveness against cancer. After discontinuation of the self-administration of fenbendazole, the patient's liver dysfunction spontaneously resolved. The antitumor inhibitory effects of fenbendazole have been reported; however, she did not experience tumor shrinkage. This is the first case report of a patient with advanced NSCLC who self-administered the anthelmintic, fenbendazole. Twitter and Facebook are online social media platforms which have been constructively used to exchange information among cancer patients. However, sources of medical information on these platforms are often unproven...*

They are popular and have now spread to every corner of the society. It has been observed that the information diffusion power of social media is much greater than conventional media such as newspapers, magazines, and TV. Social networking sites have made it easy for nonmedical individuals to disseminate complex medical information; however, this involves the risk of spreading unproven medical facts. ...

When she was next seen on August 13, 2019, blood tests showed elevated aspartate transaminase (AST) [etc.] ... Initially, we suspected liver injury as an immune-related adverse event. For this reason, pembrolizumab monotherapy was temporarily discontinued, but after interviews with her family, it was discovered she had been taking oral fenbendazole since early July 2019. She and her family had become afraid of cancer progression since her CEA levels had increased. She had purchased and started taking oral fenbendazole, which was marketed as an anthelmintic for dogs, based on information from social media sites stating it was effective against cancer. She stated her fenbendazole schedule consisted of 1 g/day PO for 3 days, followed by 4 days off, and this schedule had been maintained for approximately 1 month from early July until her August visit. We stopped fenbendazole administration immediately, and her liver function parameters gradually improved. Subsequently, pembrolizumab was recommenced, and there was no relapse in liver dysfunction. ...

Fig. 2: Chest CT images during fenbendazole administration. a CT findings just before the oral initiation of fenbendazole on July 1, 2019. b CT findings on August 15, 2019, after taking fenbendazole for approximately 1 month. [Note: no side change; didn't progress,

didn't get smaller.]. ...

Twitter is a major, globally ubiquitous social networking website where messages of up to 140 characters called "tweets" are exchanged between users. In a recent report on cancer-related tweets, the most common users who tweeted about cancer were a "family member or friend," which accounted for 49.3% of users [20]. The tweets by a "cancer patient" and "cancer survivor" accounted for 8.7% each, "news organization/journalist" was 10.1%, and the "healthcare center" was 6%. Another report indicated that the most common conversations related to kidney cancer on Twitter were about support (29.3%) and treatment (26.5%) [21]. In our case, the patient and her family received information on fenbendazole from social media sites, after which they purchased the medication and the patient orally self-administered. Interestingly, fenbendazole was marketed and sold as an antiparasitic drug for dogs." ***Conflict of Interest Statement:*** *T.H. obtained research grants from Ono Pharmaceutical, Novartis Pharma, Chugai Pharmaceutical, Eli Lilly, Taiho Pharmaceutical, AstraZeneca, Nippon Boehringer Ingelheim, Pfizer, Bristol-Meyers Squibb, Clovis Oncology, Eisai, Takeda Bio, Sumitomo Dainippon Pharma, Abbvie, Merck Serono, MSD, Kyowa Hakko Kirin, Daiichi Sankyo, and Astellas and has received personal fees from Ono Pharmaceutical, Novartis Pharma, Chugai Pharmaceutical, Eli Lilly, Taiho Pharmaceutical, AstraZeneca, Nippon Boehringer Ingelheim, Pfizer, Clovis Oncology, and Bristol-Meyers Squibb. All other authors have no conflicts of interest."*

- Nov. 7, 2023, Dr. Colleen Huber (a COVID vaccine skeptic) at colleenhuber.substack.com 'Street Meds for Cancer? Repairing the Liver After Fenbendazole' (this article is an unbalanced hitpiece).

• Fenbendazole was patented in the early 1970s by the Belgian company Janssen Pharmaceutica, already owned since 1961 by CFR (and later Trilateral and Davos financier) Johnson & Johnson. Fenbendazole always was seen as a safe, potent anthelmintic (anti-parasitic), later sometimes used in combination with Ivermectin. As for the Panacur brand, which at least in the 21st century is the main supplier of Fenbendazole, since 2010 it is controlled by Merck. The package in the Netherlands says the (licensed?) producer is Intervet (old name) / "MSD Animal Health" (name since 2011), which in the U.S. and Canada is known as "Merck Animal Health'. From 1961 to 2007 AkzoNobel controlled Intervet, which has Fenbendazole on its website as being created in the 1970s (without mentioning Janssen Pharmaceutica or Johnson & Johnson):

- July 1, 1974, Biologica journal (German), pp. 753-754, 'Fenbendazole: A new, highly effective anthelmintic' ('Fenbendazole: A new, highly effective anthelmintic'): *"At a dose of 5 to 10 mg/kg PO ["per os", Latin*

for "by mouth"], fenbendazole acts on all major gastric and intestinal nematodes [worms], including some organ nematodes of pigs, sheep, cattle and horses, not only the adults, but also the developmental stages that are difficult to influence with chemotherapy (O. ostertagi [medium stomach worm / brown stomach worm]) can be virtually completely eliminated. With extremely good tolerability (up to 1000 times the therapeutic dose) and no teratogenic effects, a promising anthelmintic could be developed."

- fenbendazoleaustralia.com.au/fenbendazole-information/fenbendazole-history/ (accessed: May 24, 2024): *"Fenbendazole was first developed in the 1970s by Janssen Pharmaceutica, a Belgian pharmaceutical company that is now part of the Johnson & Johnson group [actually, already since 1961]."*
- msd-animal-health.nl/over-ons/historie/ (accessed: May 24, 2024): *"1961: Koninklijke Zwanenburg Organon (later AKZO NOBEL) neemt Intervet over. ... 1970s: ... Ontwikkeling van anthelmintica fenbendazol (Intervet). ... 2007: Schering-Plough neemt Organon Biosciences (Intervet en Organon) over van Akzo Nobel. De diergezondheidsdivisie heet vanaf nu Intervet / Schering-Plough Animal Health."*
- June 29, 2011, merck.com, 'Merck Announces New Name for its Animal Health Division': *"Merck's (NYSE: MRK) animal health division, formerly known as Intervet/Schering-Plough Animal Health, announced that effective today it will begin using the new name, Merck Animal Health. It will be known as MSD Animal Health outside the United States and Canada."*
- Jan. 4, 2022 YouTube upload by 'Adam Payne', 'Q&A Session with Joe Tippens' (annoying aspect of the show: they keep talking about "pathway 1", "pathway 2", "pathway 3", "pathway 4" without respectively saying CBD, curcumin, berberine and gree tea extract): *"**[HOST:]** We have a question from Victoria: What are your reasons for recommending Merck versus pure Fenben products? **[TIPPENS:]** Boy, that's a loaded question. At least one of the other products I had tested, and it is not pure Fenben. Some of them are fraud products. The other reason I recommend Merck is because I know Merck is manufacturing everything in an FDA approved GMP facility. I have yet to get confirmation that the competing products are manufactured that way. [The there] are the legal aspects of offering non-FDA approved drugs to humans...*

  The question is: is it possible to determine how long it takes for Panacure to start working? Boy, there is a great question, because we have seen all the way from 4 weeks at the earliest to 18 months at the latest. Don't ask me why, because I really don't know. I can tell you that with some of the most amazing cases, with 7 stage 4 cases of pancreatic cancer, in 5 of those the cancer was held at bay and

people were able to resume a normal lifestyle. But it never eliminated the cancer. The cancer was always there; just kept at bay. But in two of those cases, after 18 months they became NED [no evidence of disease.], which for 4th stage cancer is unheard of. So I tell people, if you've got cancer, take it 7 days a week indefinitely. Don't stop. And then, once you are NED, if you are lucky enough to get there, then go into a maintenance mode. ...

I'm unique. I had whole brain radiation as a preventative measure, and that wiped out 40% of my short-term memory. The chemo wiped out my hearing.

[HOST:] Did the Endolift at all help you? [TIPPENS:] I don't know. I just started. [HOST:] Yeah, we do have another product though called Endolift and it helps to rebuild neurotransmitters in the brain. If anybody has chemobrain...

[TIPPENS:] Let's all remember what Fenbendazol is doing. It has 3 pathways. Number one, it is knocking out the microtubials that allow cancer cells to replicate and divide. Number 2, it is spiking production of new, healthy P53 - the cancer-killing gene. And number 3, it is interrupting the cancer cells' ability to metabolize sugar. So combined with berberine, which is lowering the blood sugar and is interrupting the cells' ability to metabolize sugar, you've got a dual whammy there. ...

[TIPPENS:] He says: how many milligrams of Panacur-C does a 250lb man need each day for pancreatic cancer. Let's talk about that, because I've always just recommended 222mg a day, regardless of weight, because the weight dependency, if you are trying to kill intestinal parasites, matters. But at the cellular levels for cancers I'm not sure that it matters. Now, having said that, there are thousands of people out there that have taken it upon themselves to increase the dosage from 2x to 3x ... and they've had successes. I just haven't recommended that, but if people want to try it ... there's lots of people having success doing that. ... No, I don't so [that I heard any downsides]. ... There has been a toxicity clininal trial with the sister Mebendazol at Johns Hopkins. And they determined that 500mg long-term is safe. And I don't think Fenbendazole is that much different. ... The recommendation is 222-250mg a day. But many people are doubling or tripling that dose and you want to watch your liver enzymes if you do that. ... Again, the research that shows ... that Fenben could actually negatively impact the liver, we know from the Johns Hopkins toxicity trial that 500mg a day long-term is safe. And very few people that stay at 500mg or below, have any problems with their liver. ANd I'll add that the research that caused that concern and they did that research at 1,000x the dosage. Instead of 500 mg, take 500,000 mg. ... Let's differentiate between cancer on a liver and liver enzymes from

possible interactions with Fenbedazole. We know that it workd liver cancer. And we know that it works for pancreatic cancer. And in fact in most cases we know that it keeps the pancreatic cancer at bay while not necessarility eliminating the cancer all the way to NED. ...

There's still hope [when your cancer is growing on Fenben, Sir, even though taken 2,000mg of Fenben a day]. And I tell you why. We've seen quite a few cases where the cancer got worse, right before it got better. [note: maybe he observed "pseudoprogression".] Don't ask me to explain why. It doesn't make any sense to me. But it can happen. So if it is not causing any problems, stay with it indefinitely, 7 days a week. ... [note: maybe he could have suggested adding vitamins/minerals, extra supplements (pathways), go on keto, and fast...]

I don't practice what I preach. I preach that you should eliminate sugar and anything that converts to sugar - and then I go eat candy. So I really believe if you are really serious about it, go on a plant-based diet with eliminating as much carbs as you can, but also these protocols help lower than blood sugar availability as well. ...

I'll just say again, this isn't a cure-all that will solve every single cancer immediately. We don't know the denominator and we do know that there are failures. I just know that the downside risk is so low [that] there's no reason not to try. ... I have not heard that before from anybody. If you are getting joint [or bone] pain ... I doubt it comes from Fenbendazole...

In our success database, we do know of people who didn't do the curcumin, didn't do the CBD - and only did the Fenben and had the success. If you are afraid or - of the pathways, there is no reason not to try the Fenben alone. ...

I'm in the camp that is skeptical of Ivermectin and cancer. A lot of people said it works for Covid and other things, but I'm not a believer that it has an impact on cancer. ...

Here's what I know. We have dozens of cases where, "3 months to live, nothing else we can do." And that was 3 years ago. ... The downside risk is literally zero, so why not try. ...

Yes, there have been successes reported in on virtually all of the blood born cancers. ...

Yeah, some really amazing ones [success stories with skin cancer]. In fact, a local businessman pulled me aside at a country club and wanted me to show his son's white metastases before and after [not properly audible] It was very exciting. And we even had people have success topically by buying the paste-form - I think it's for goats - and applying it topically as well. ...

"Oncologists are suggesting Fenbendazole comes back stronger and more vigilant." Well, I can't answer that. I know a lot of oncologists that say just the opposite. ... I am NED for 5 years and I am the sole data outlier in 45 years in my hospital. ...

Believe me, with thousands reporting in [at the moment?], there's only one where we don't know if it works or not and the rest of them we have successes."

IVERMECTIN

Basics

- Ivermectin first rose to fame and infamy in 2020 as an alternative drug to treat COVID. This makes the subject susceptible to both rent-a-skeptic / government and "conservative CIA"-type disinformation.
- Similar to fenbendazole, which appears to be very effective against all forms of cancer in many or most people, it originally strictly was an antiparasitic drug, often used alongside fenbendazole.
- Ivermectin is often mentioned as aiding in the eradication of cancer:
  - **YouTube comment:** *"Since I have been treating my chickens with Ivermectin monthly, I have lost zero to cancers and those horrid respiratory infections. Just saying."*
- Anti-cancer studies related to ivermectin show that it at least can be used effectively in a cocktail:
  - May 5, 2021, Oncology Times, 'Use of the Anti-Parasitic Drug Ivermectin to Treat Breast Cancer': *"In these studies, 40-60 percent of animals treated with the ivermectin plus anti-PD1 antibody combination completely eradicated their tumors. They were able to fight off the cancer again after it was reintroduced. It's the two drugs working together that is the magic. Either drug alone has almost zero effect, but together they have a powerful synergistic effect."*
